Santa Cruz Galaxy Workshop, August 10, 2011

Why Bother With Quasars?

- Most if not all galaxies harbor a supermassive black hole (SMBH) in their centers (e.g., Kormendy & Gebhardt 2001)

- SMBH mass is correlated with host properties such as mass, velocity dispersion and morphology

Magorrian+1998; Gebhardt+2000; Ferrarese & Merritt 2000; Graham+2001

- SMBH growth thought to be dominated by “quasar mode” accretion (e.g., Soltan 1982)

How/When QSOs Turn on

Galaxy Mergers (e.g., Mihos & Hernquist 1996)

Can occur during two phases

a) After First Passage

How/When QSOs Turn on

Galaxy Mergers (e.g., Mihos & Hernquist 1996)

Can occur during two phases

a) After First Passage

Tidal torques → Bar Formation → Gaseous Inflow

How/When QSOs Turn on

Galaxy Mergers (e.g., Mihos & Hernquist 1996)

Can occur during two phases

a) After First Passage

b) During Final Coalescence

How/When QSOs Turn on

Galaxy Mergers (e.g., Mihos & Hernquist 1996)

Can occur during two phases

a) After First Passage

b) During Final Coalescence

Secular Process: i.e. “Non-Merging”

e.g. Ciotti & Ostriker 2007

How/When QSOs Turn on

Galaxy Mergers (e.g., Mihos & Hernquist 1996)

Can occur during two phases

a) After First Passage

b) During Final Coalescence

Secular Process: i.e. “Non-Merging”

e.g. Ciotti & Ostriker 2007

Single Galaxy

Single Galaxy

$z = 0.3693$

$\Delta v = 159 \pm 20 \text{ km/s}$

$b = 38 \text{ kpc}$

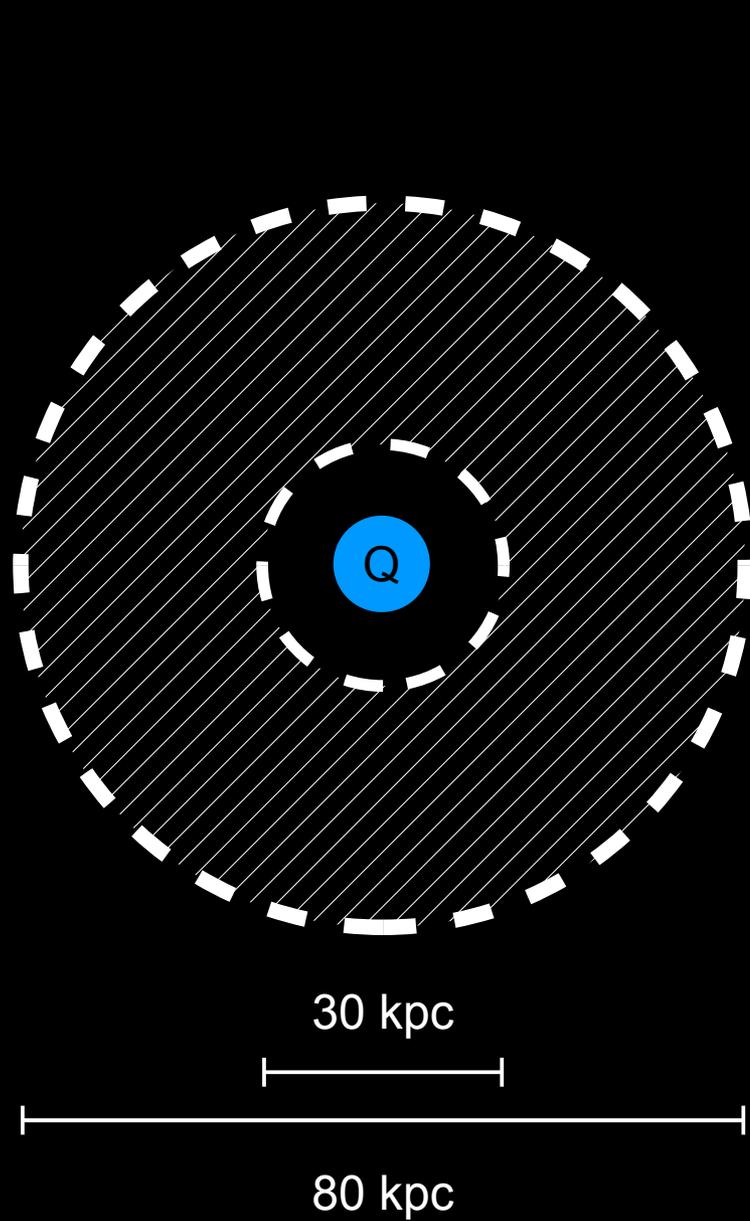

Q

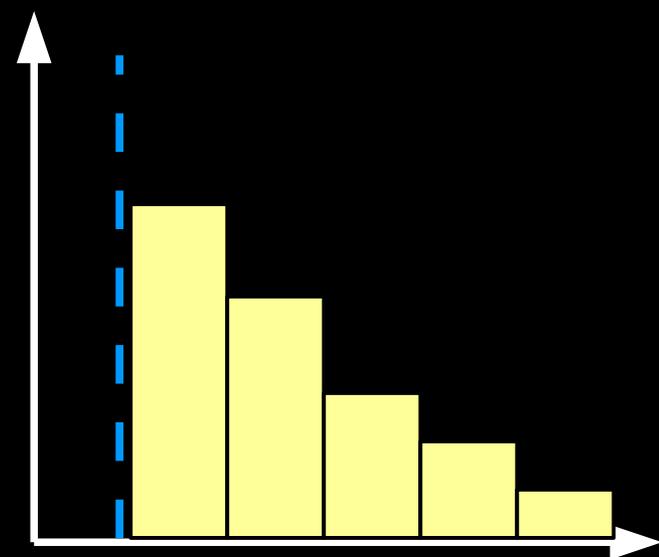

30 kpc

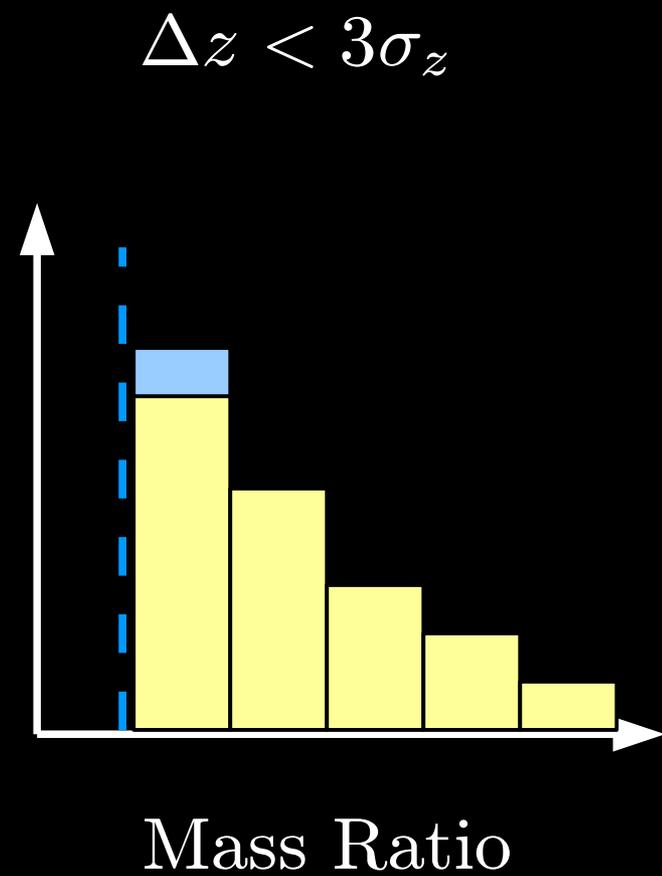

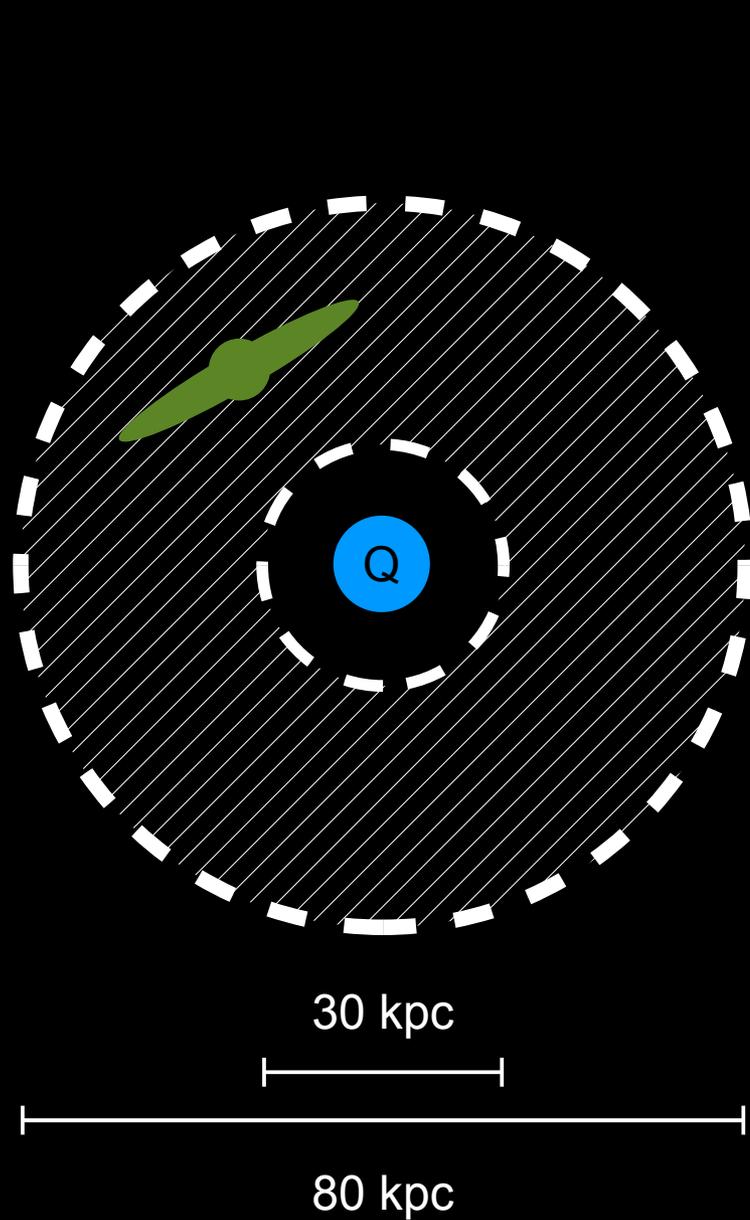

80 kpc

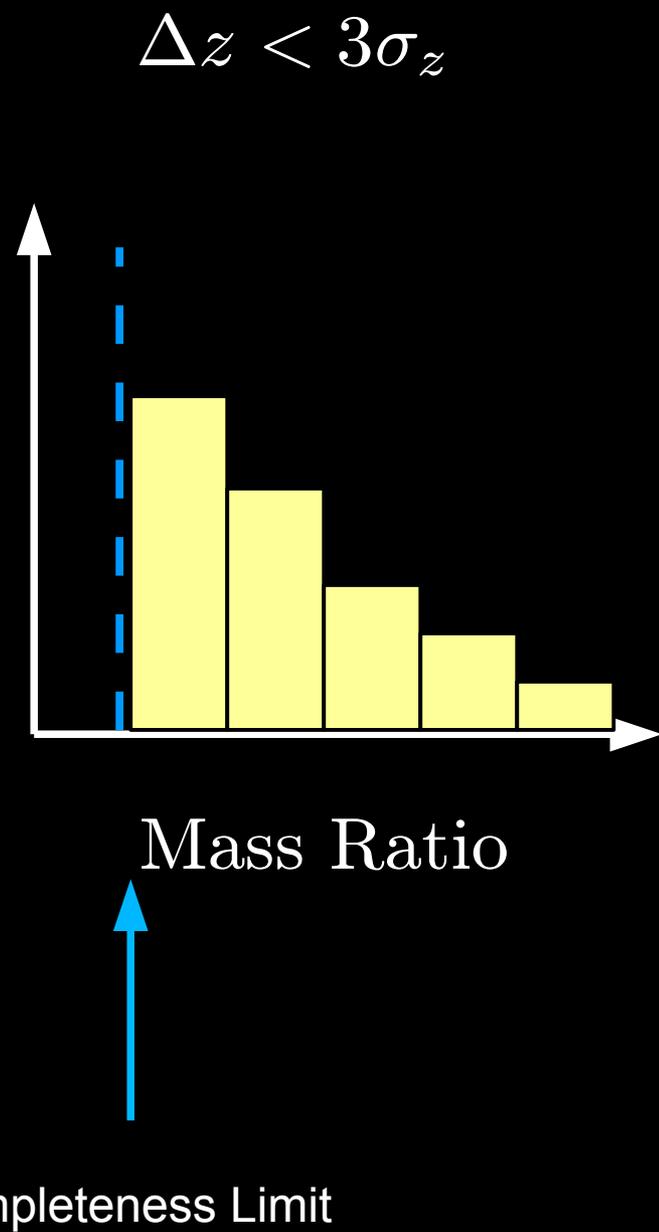

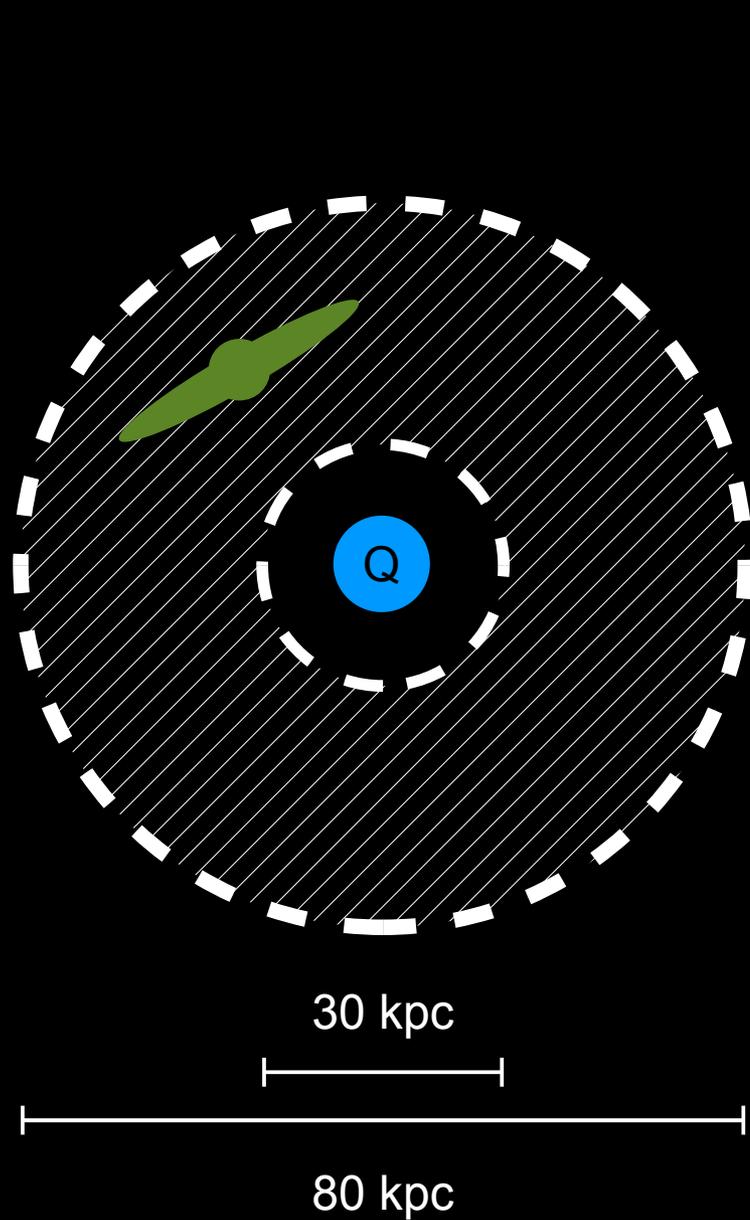

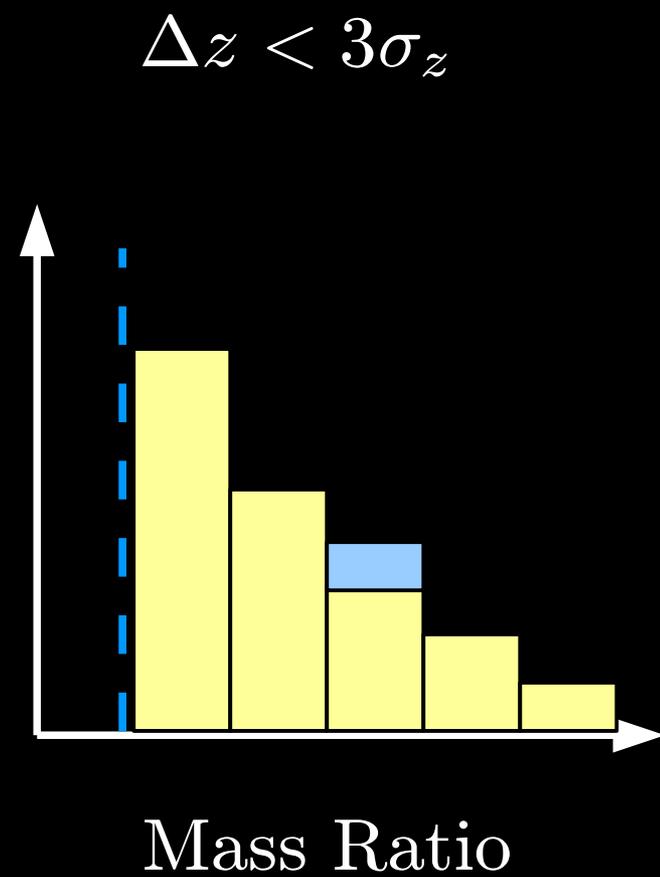

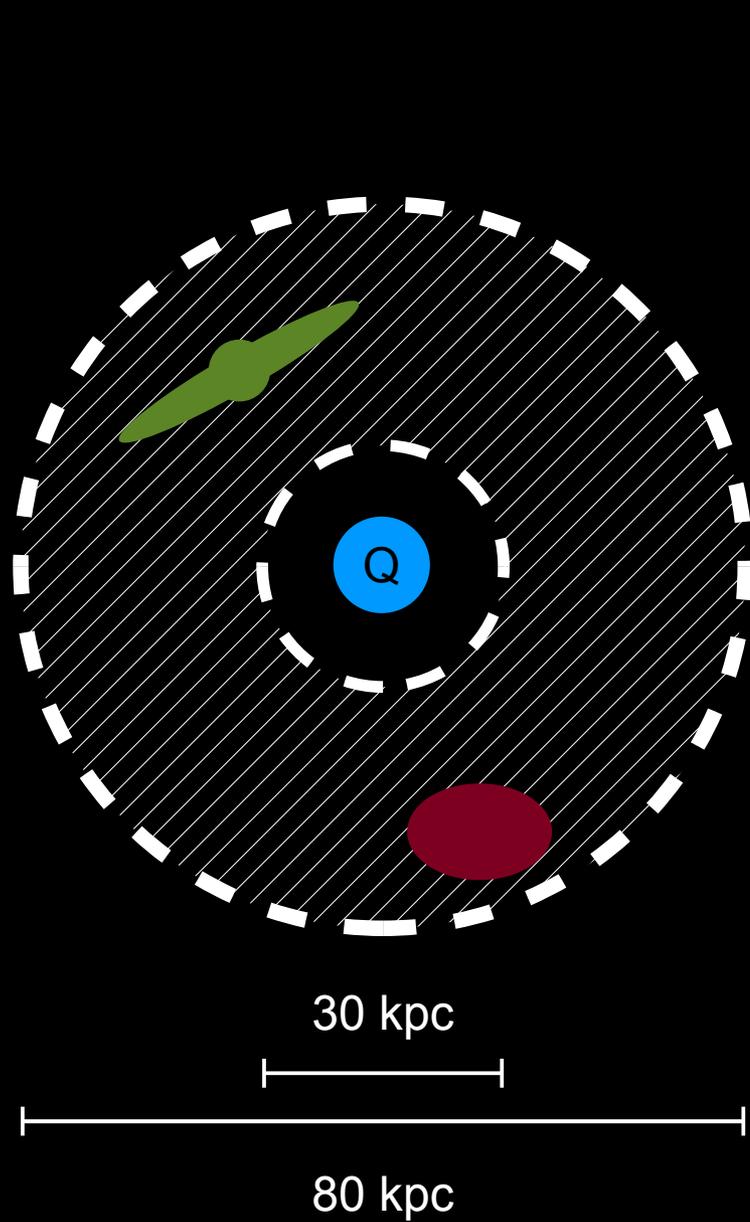

$$\Delta z < 3\sigma_z$$

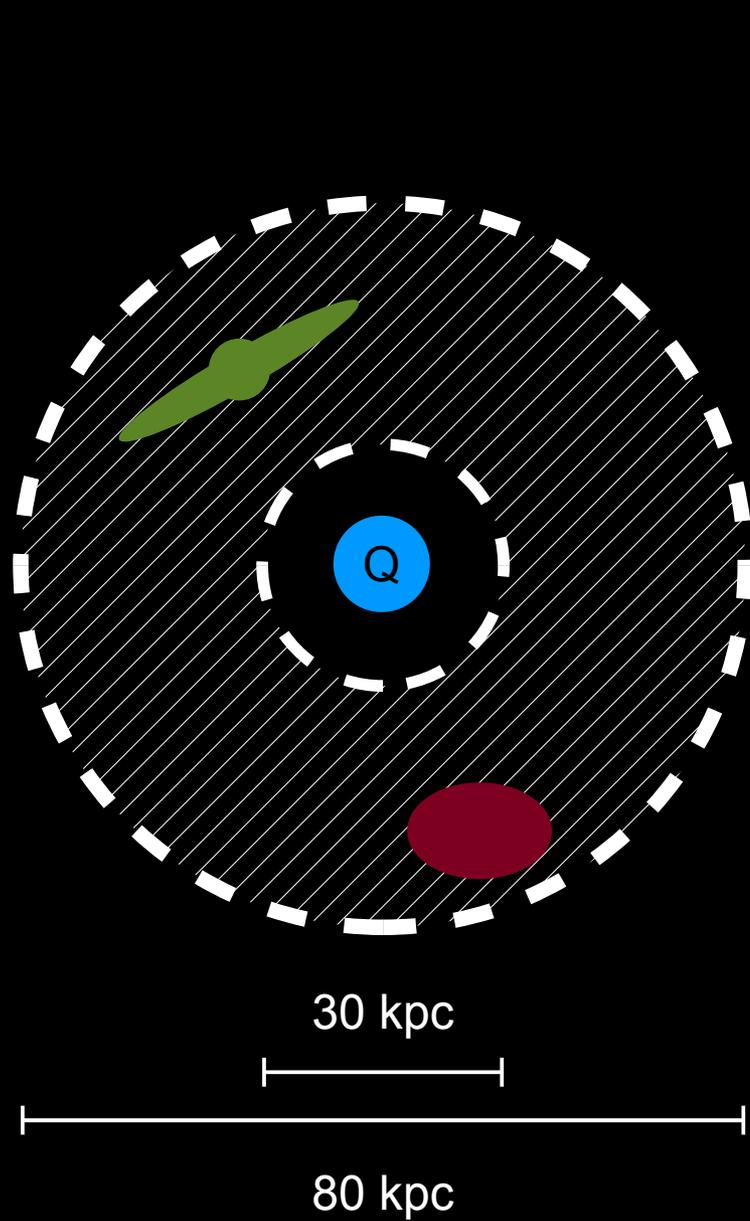

Mass Ratio

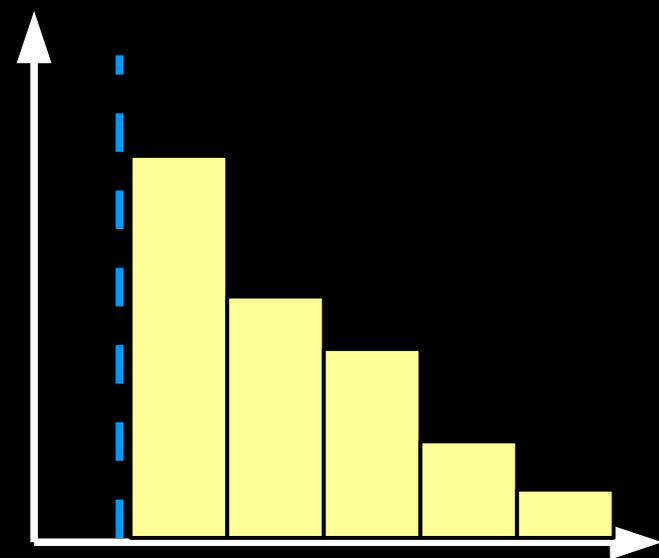

$$\Delta z < 3\sigma_z$$

Mass Ratio

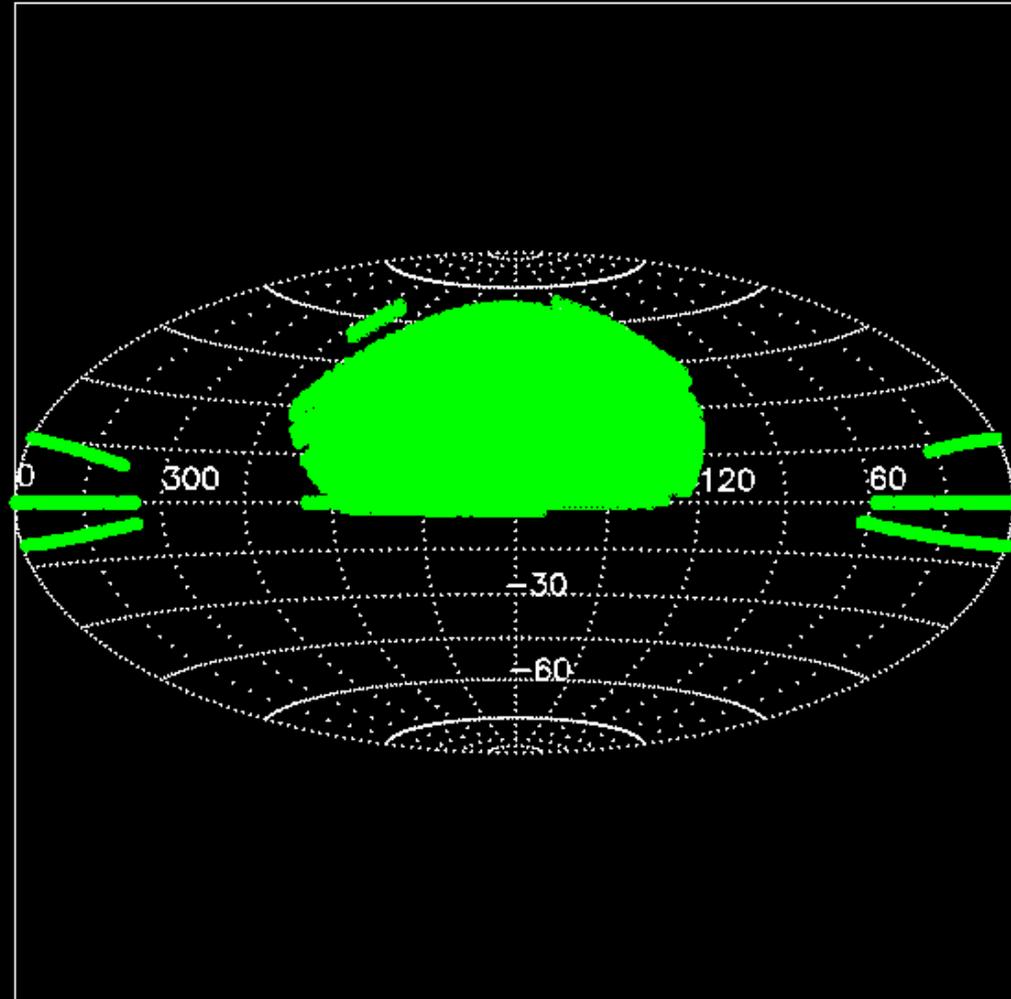

Our Sample

- We have a catalog of SDSS $z < 0.2$ quasars with estimated BH masses (Shen+ 2010)

- The Magorrian relation tells us

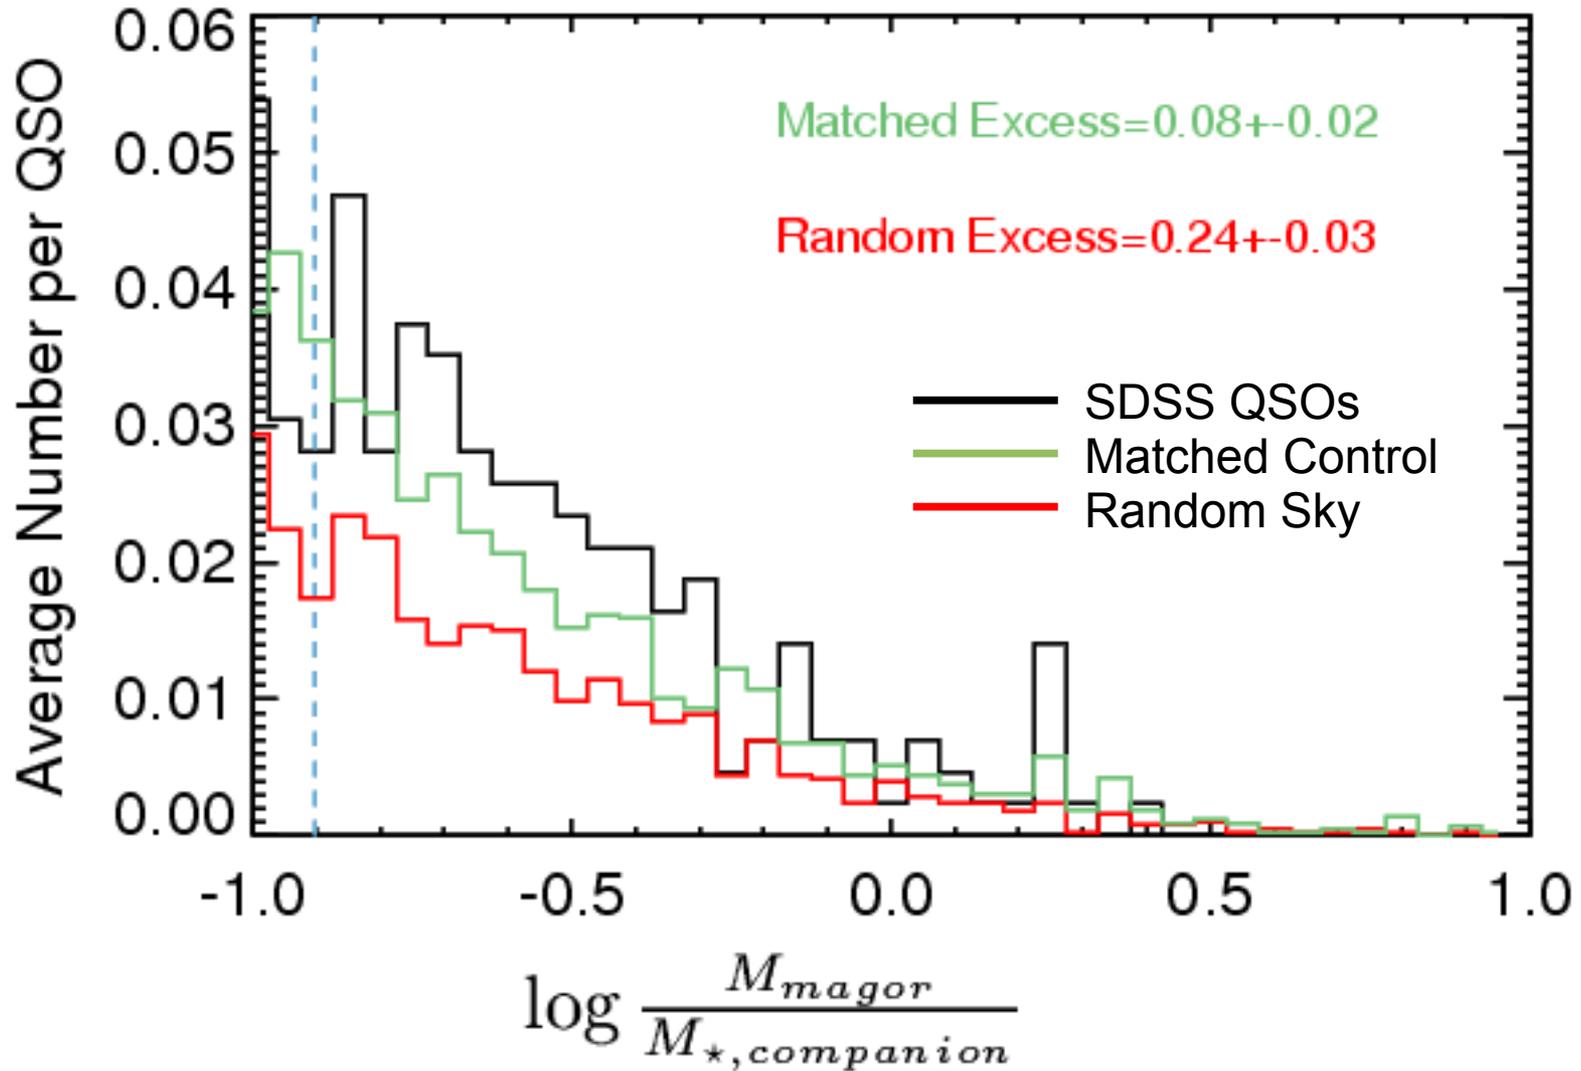

$$M_{\star} \sim 167 M_{BH}$$

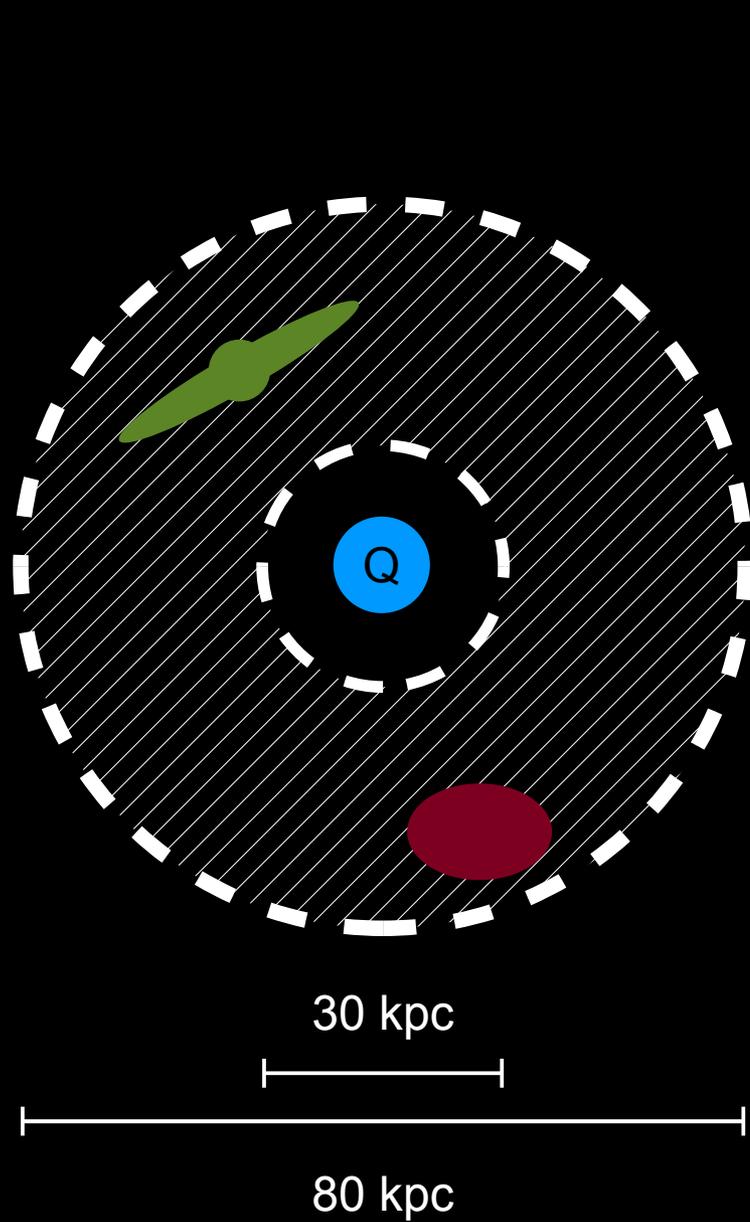

- We can use *ugriz* photometry to estimate stellar masses of nearby projected galaxies as well as their photometric redshifts

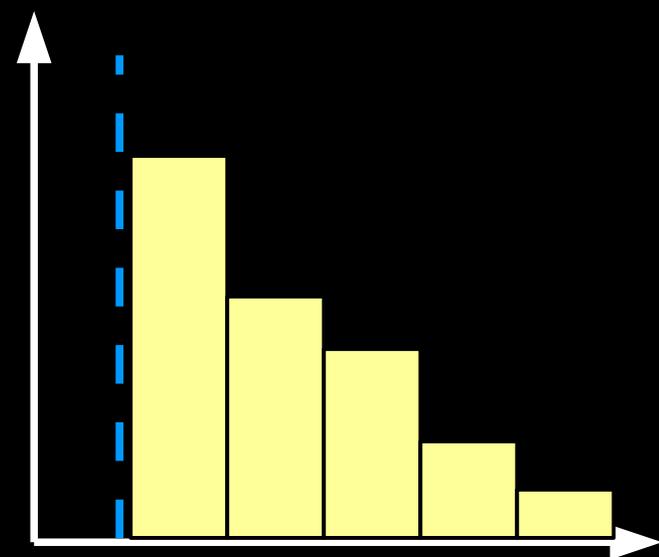

SDSS DR7 Spectral
Footprint

Detected Excess

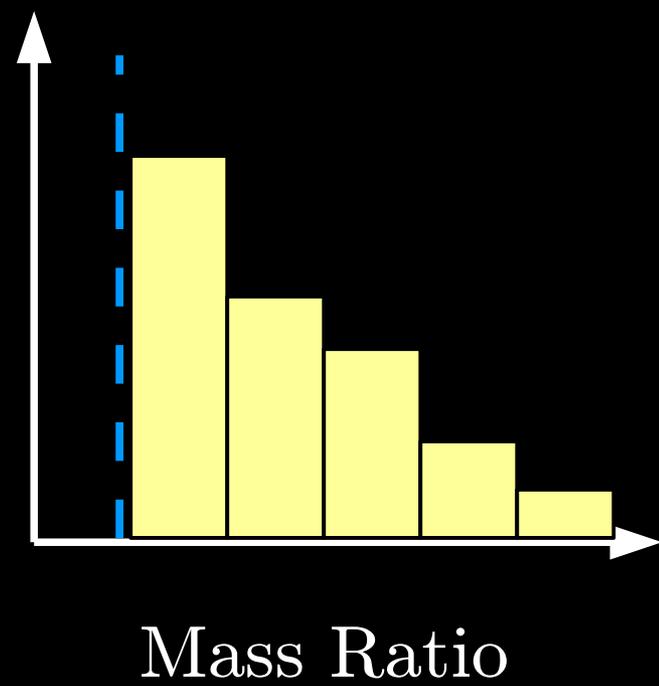

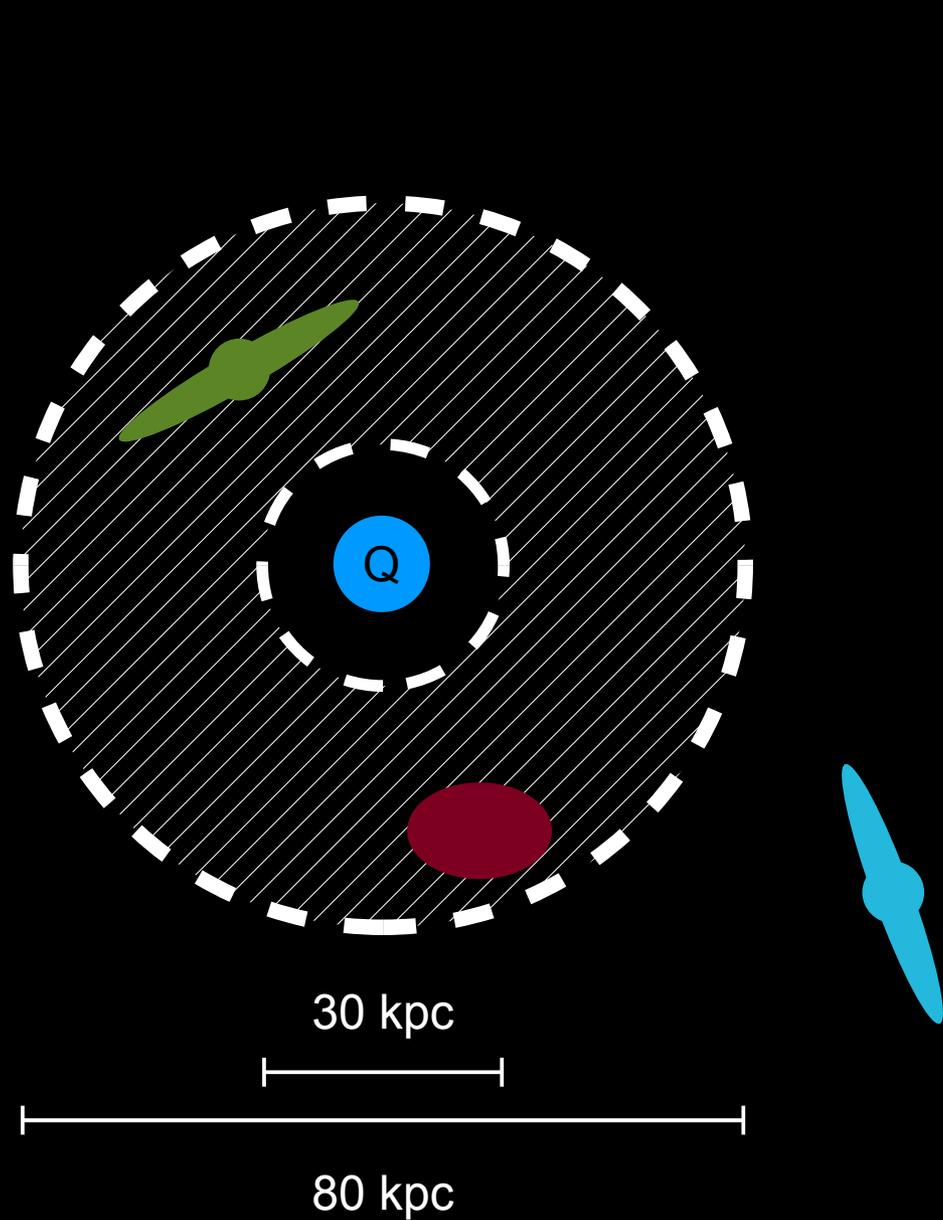

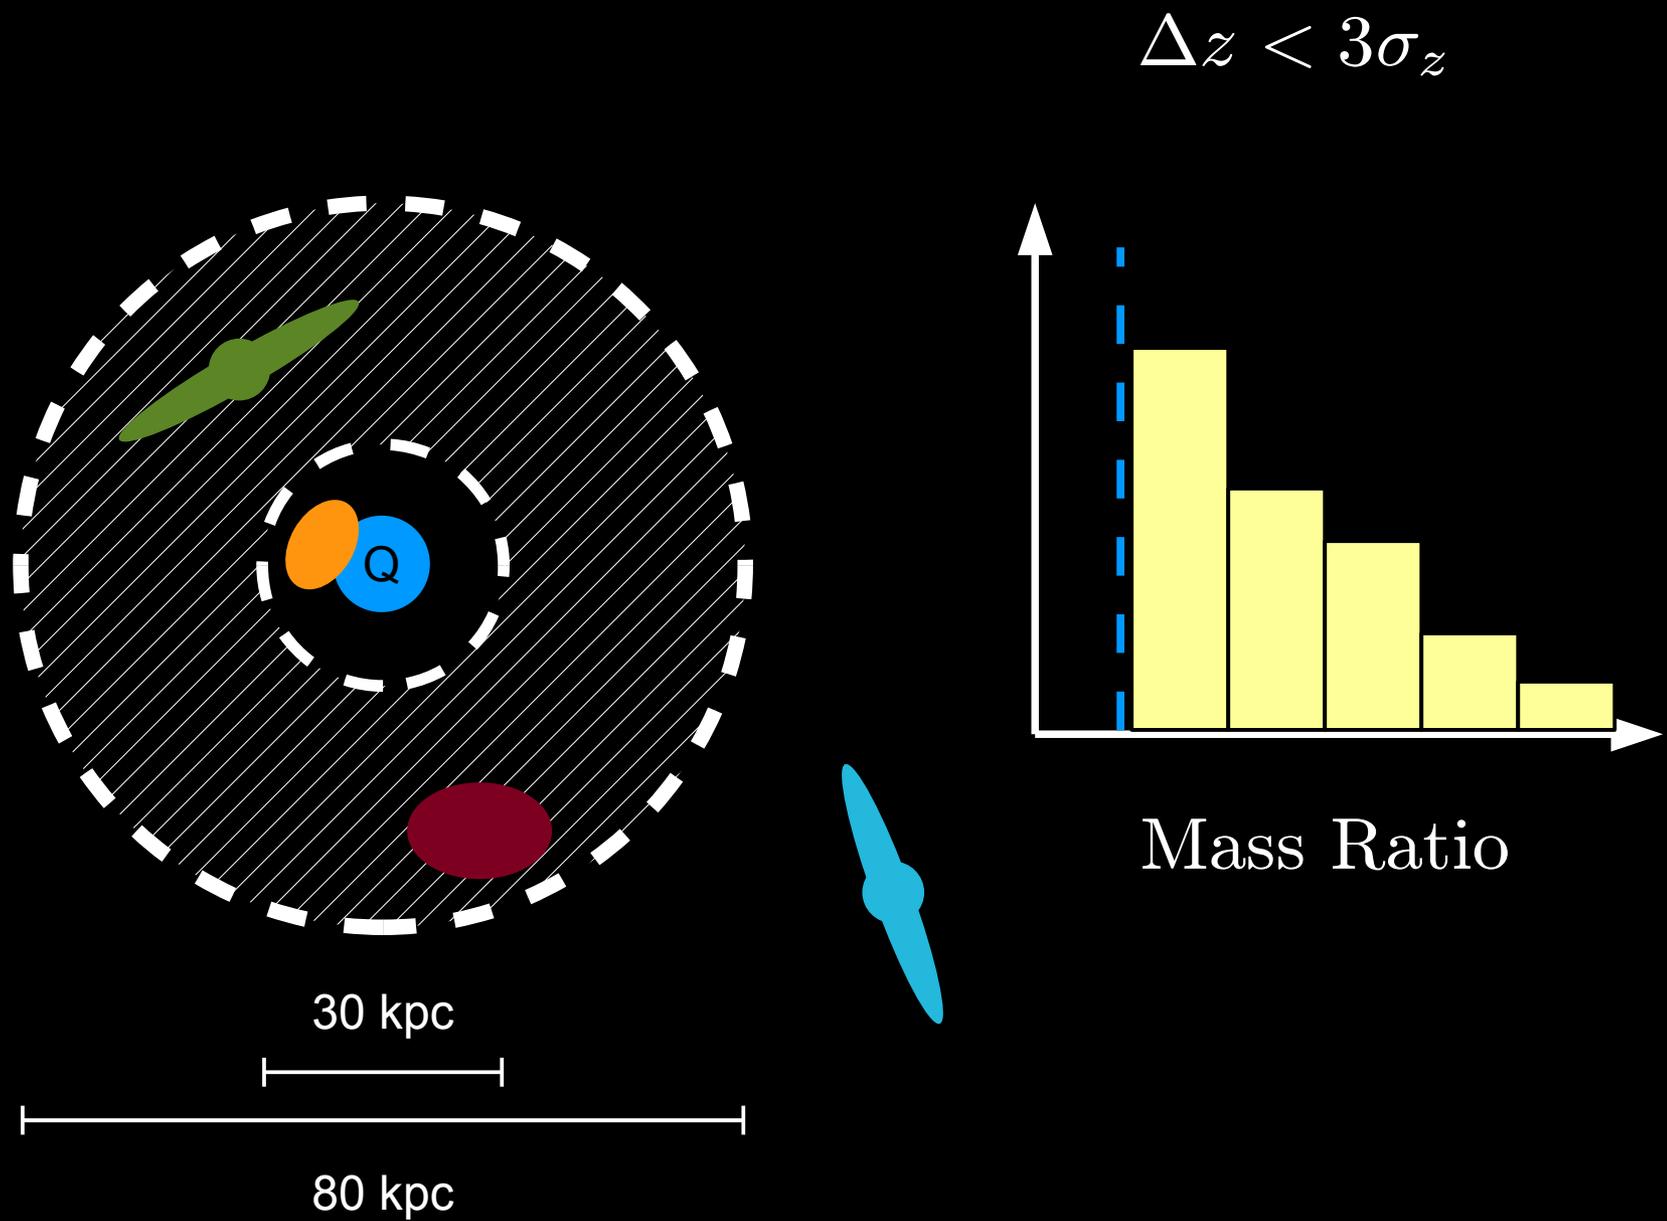

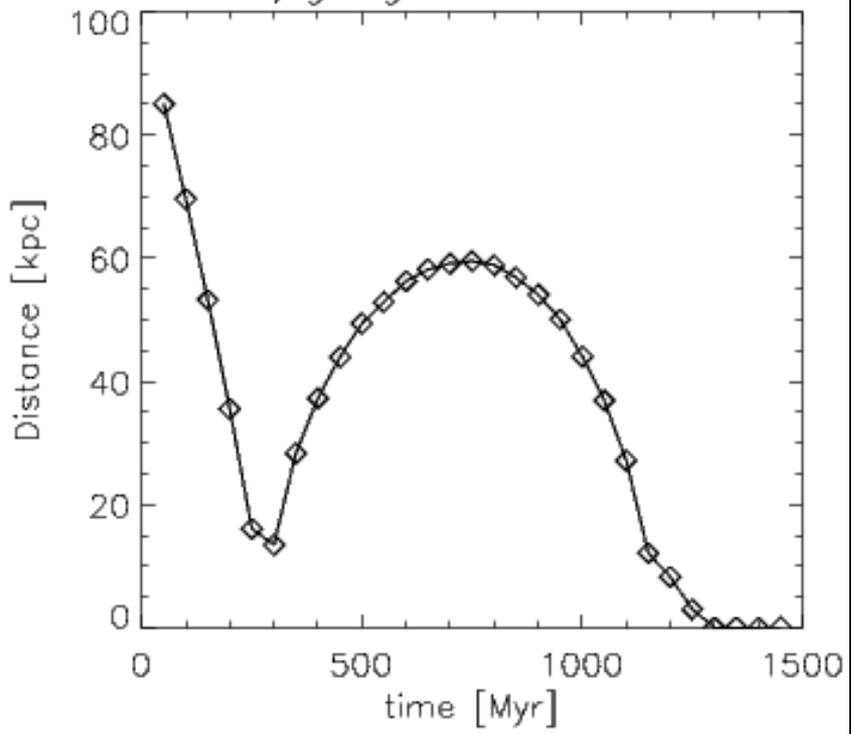

$$\Delta z < 3\sigma_z$$

Completeness Correction

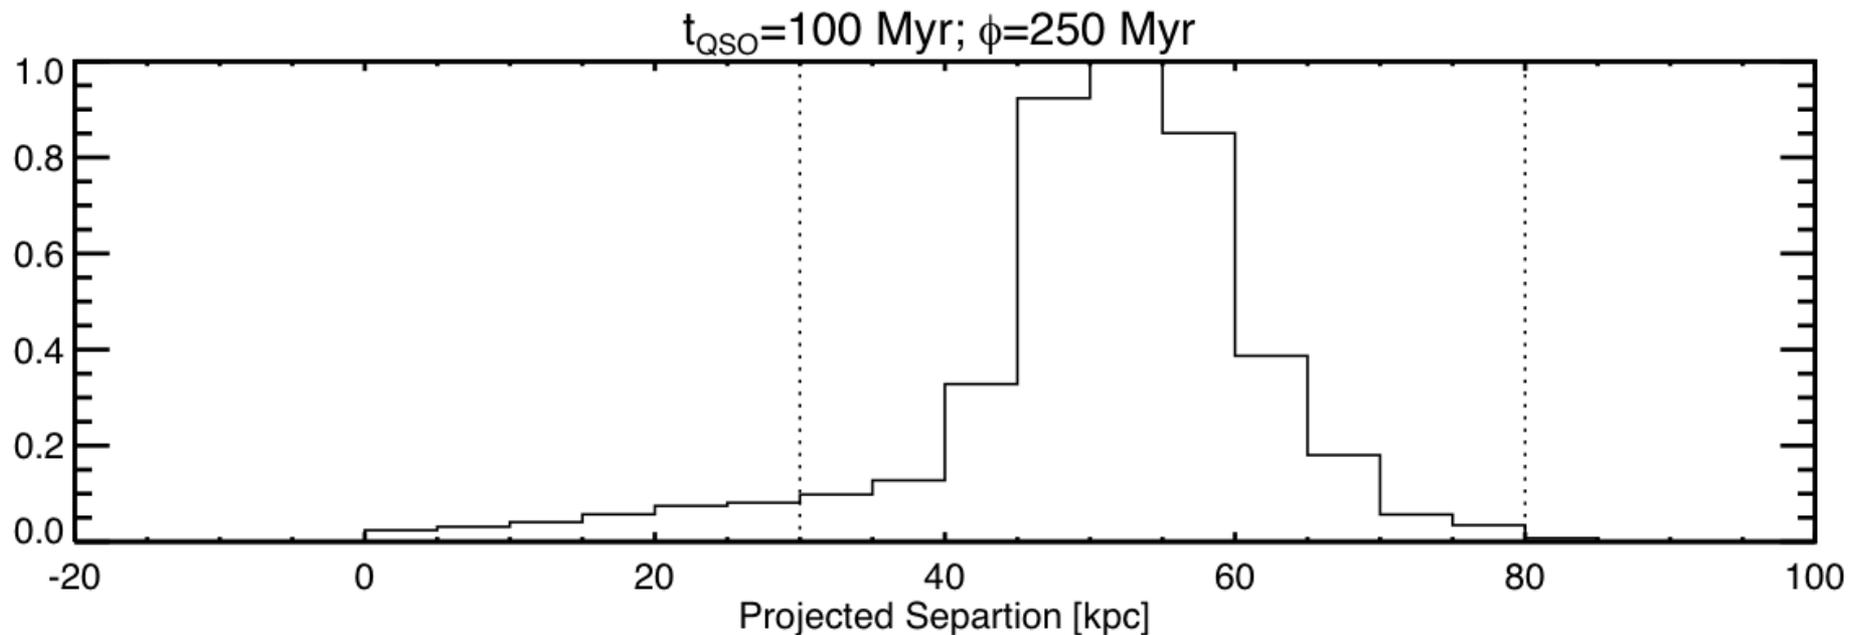

Completeness Correction

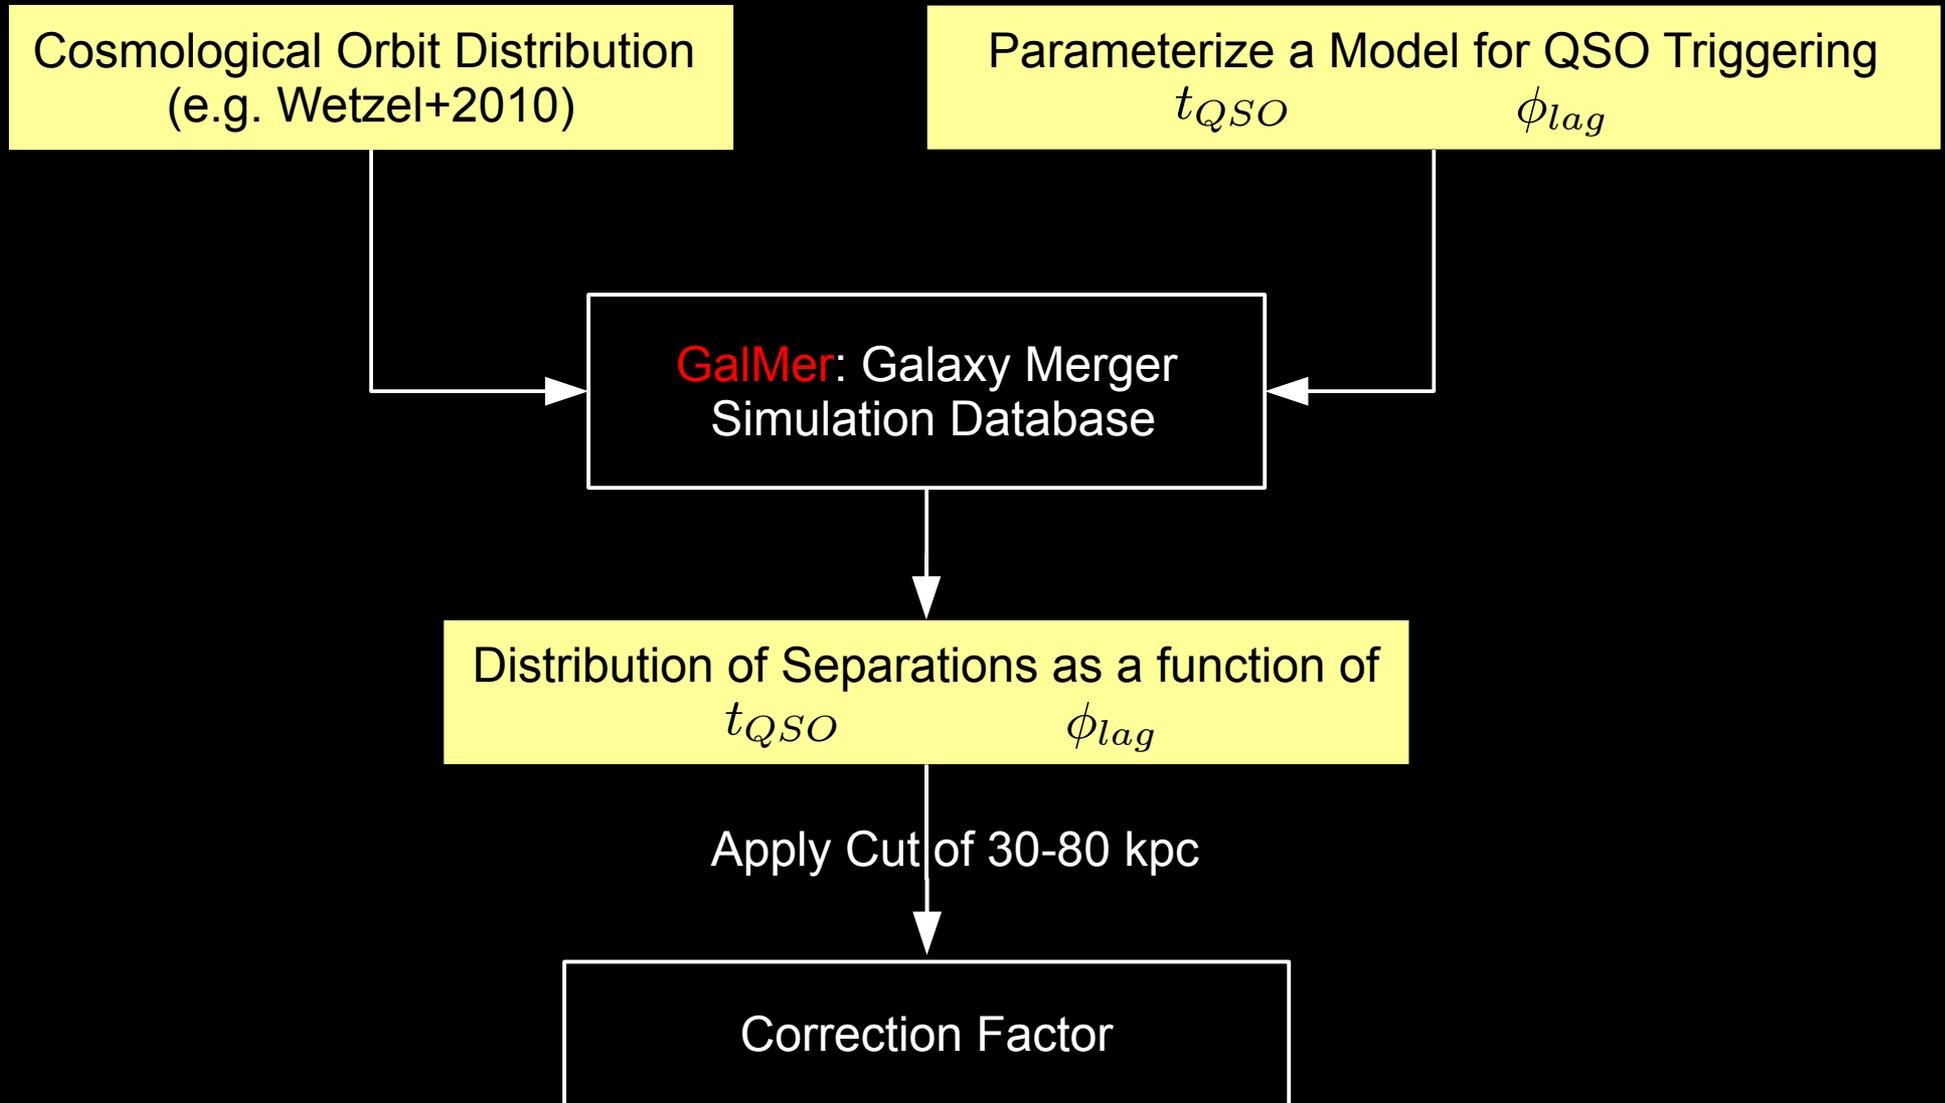

Cosmological Orbit Distribution
(e.g. Wetzel+2010)

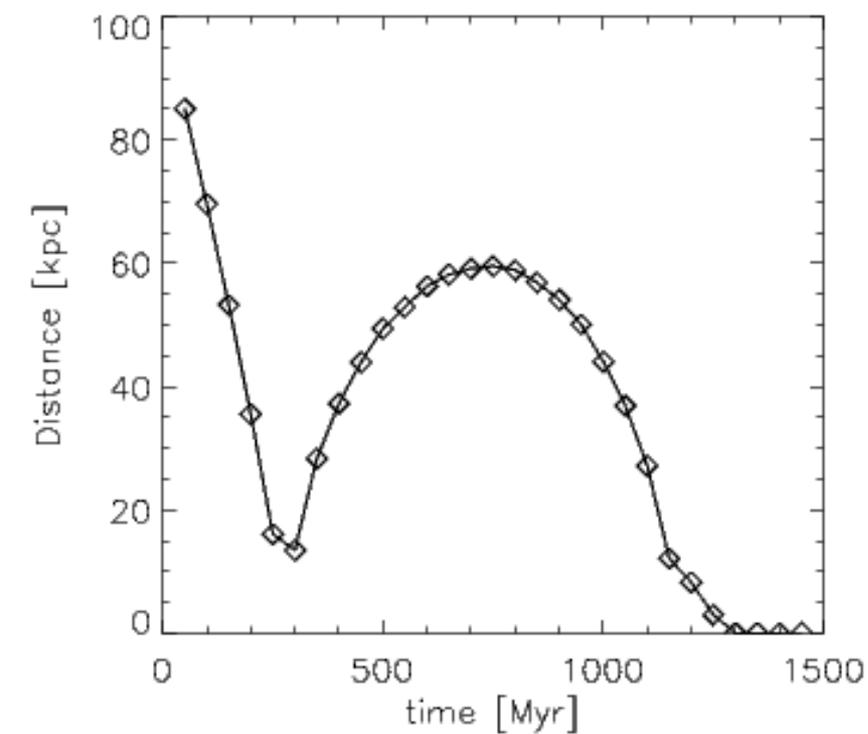

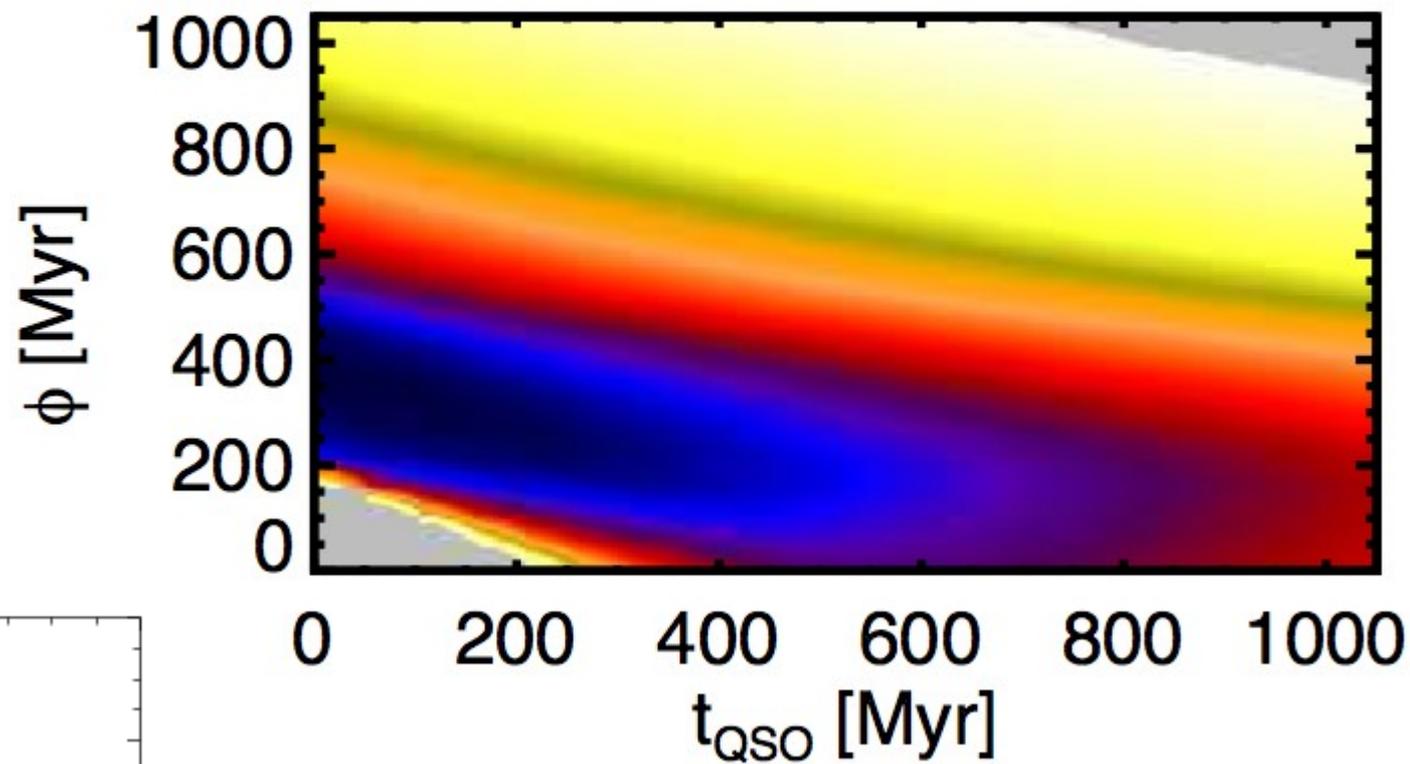

Parameterize a Model for QSO Triggering
 t_{QSO} ϕ_{lag}

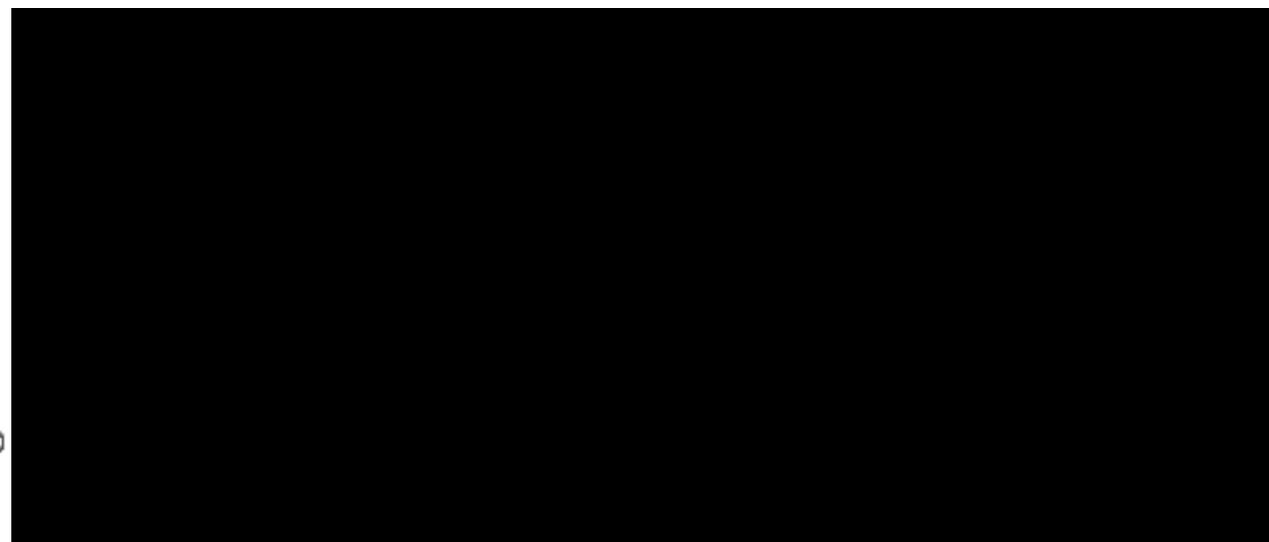

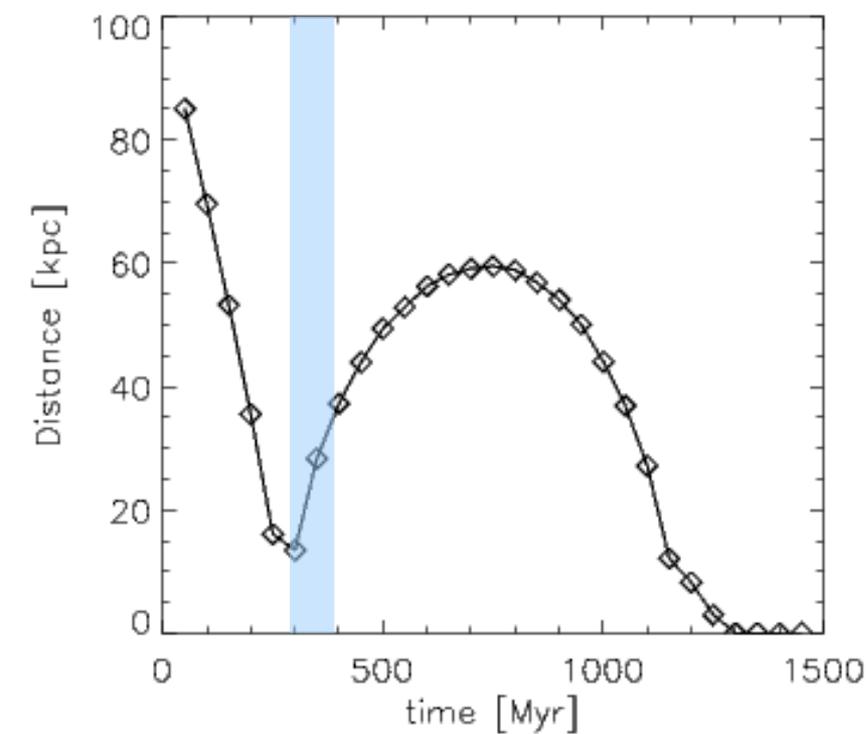

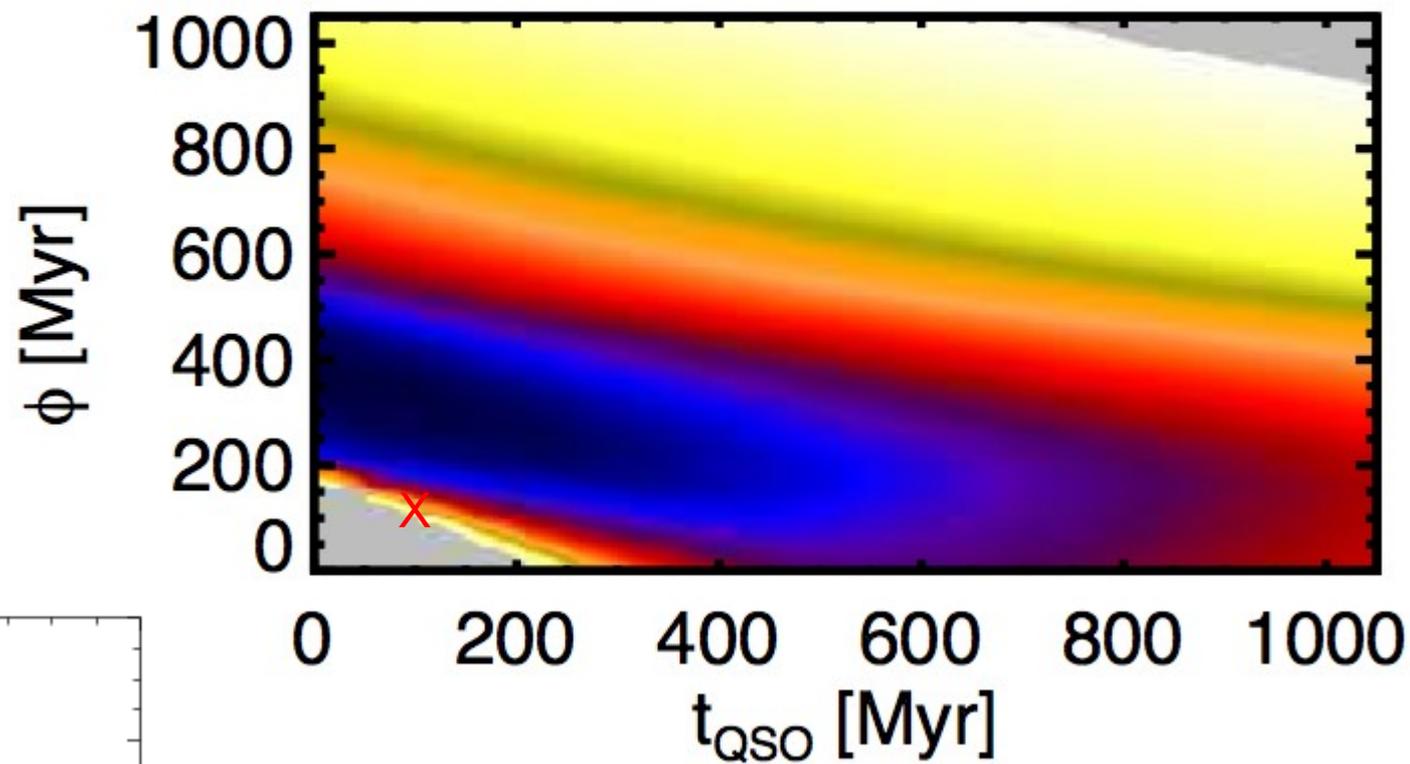

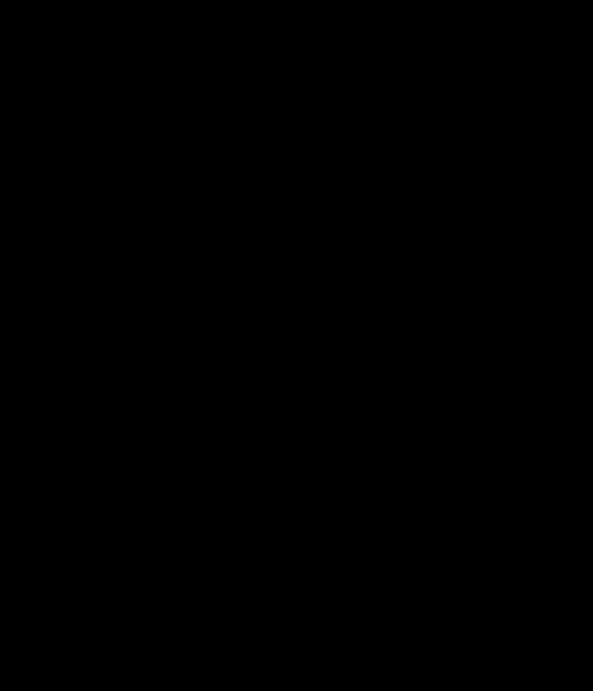

GalMer: Galaxy Merger
Simulation Database

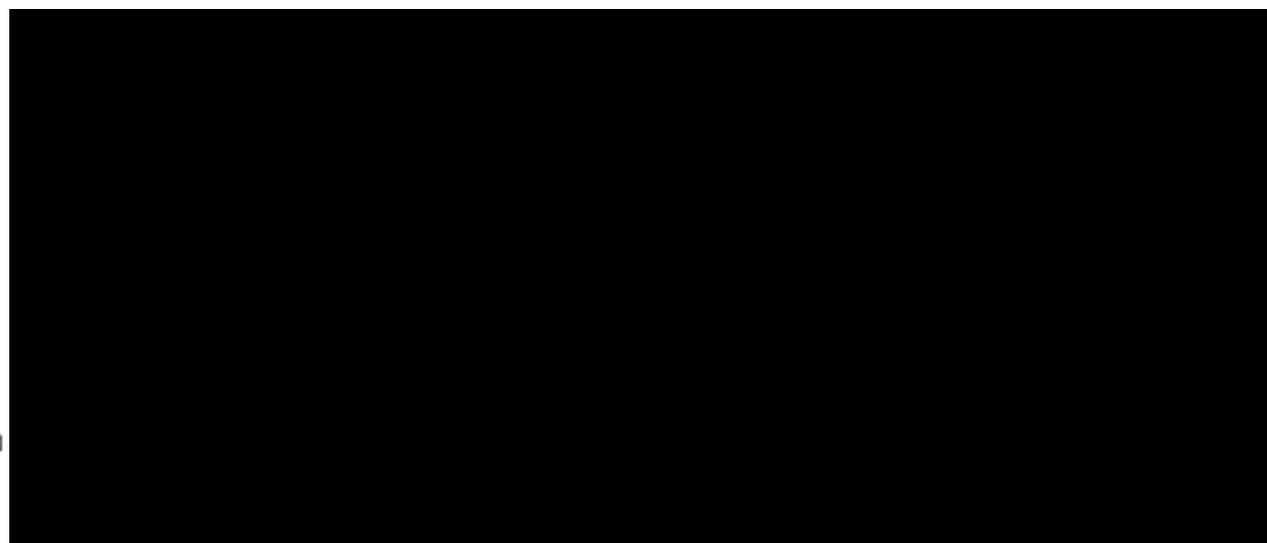

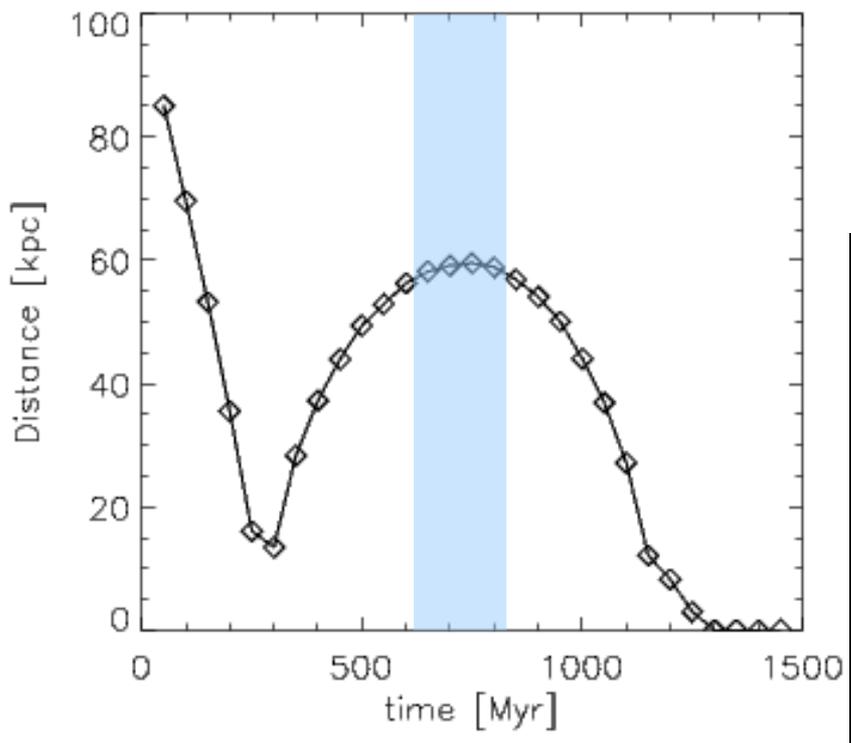

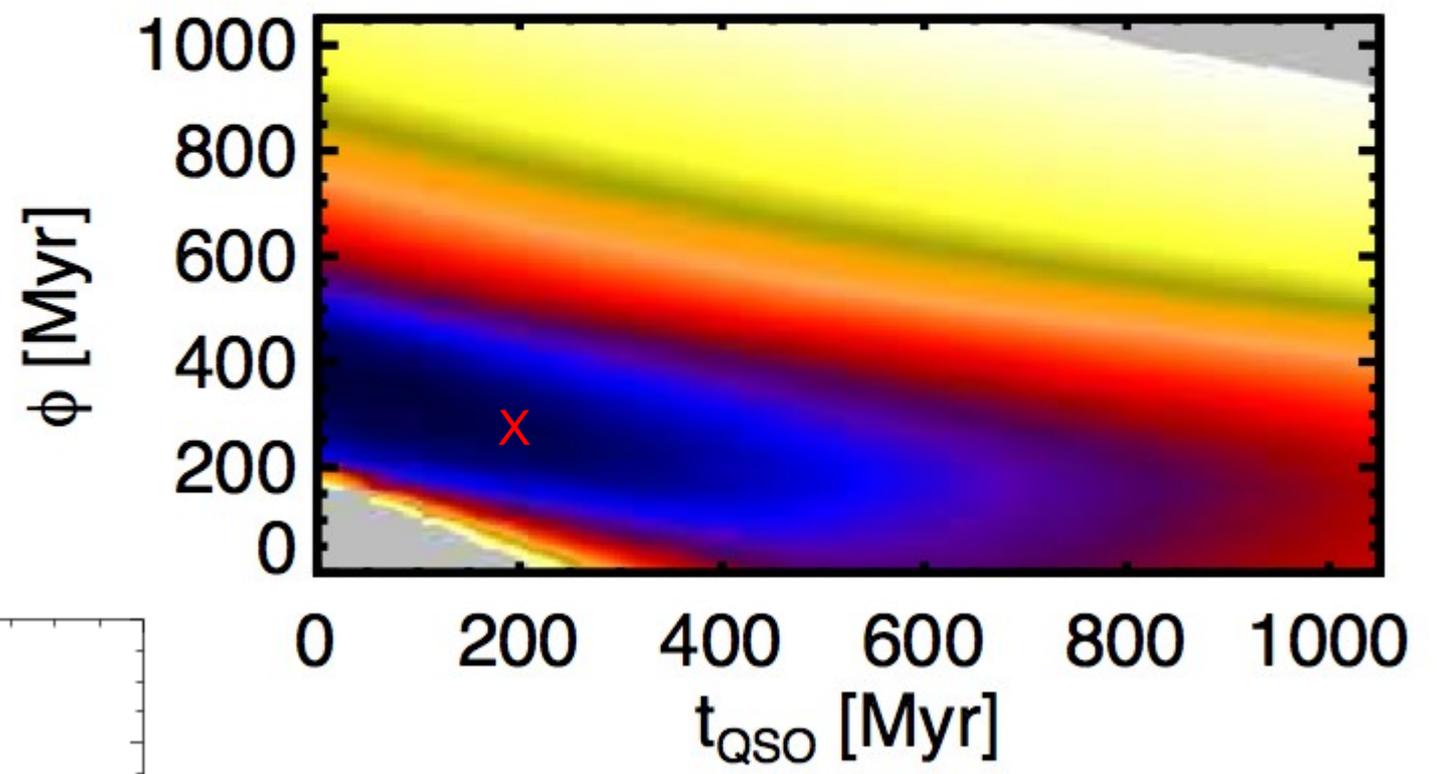

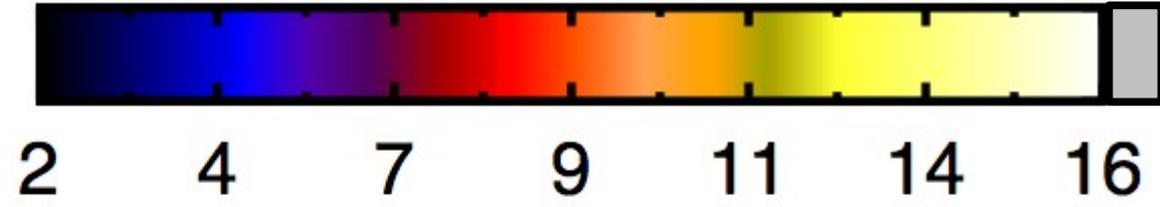

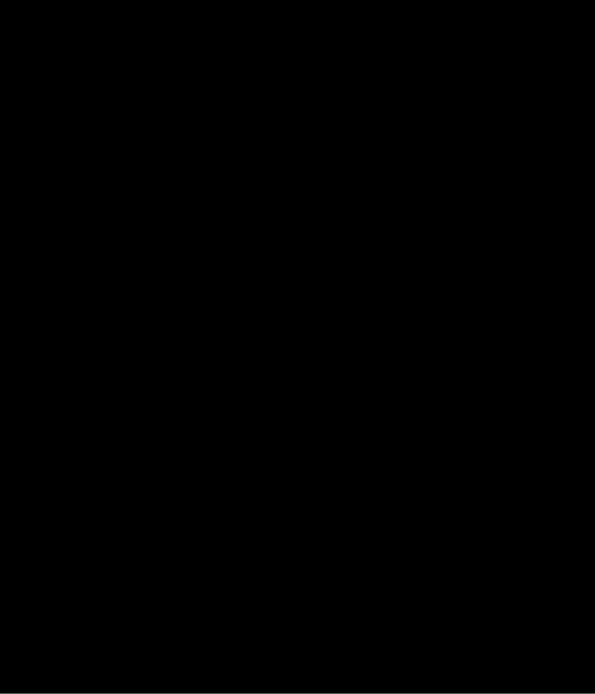

Completeness Correction

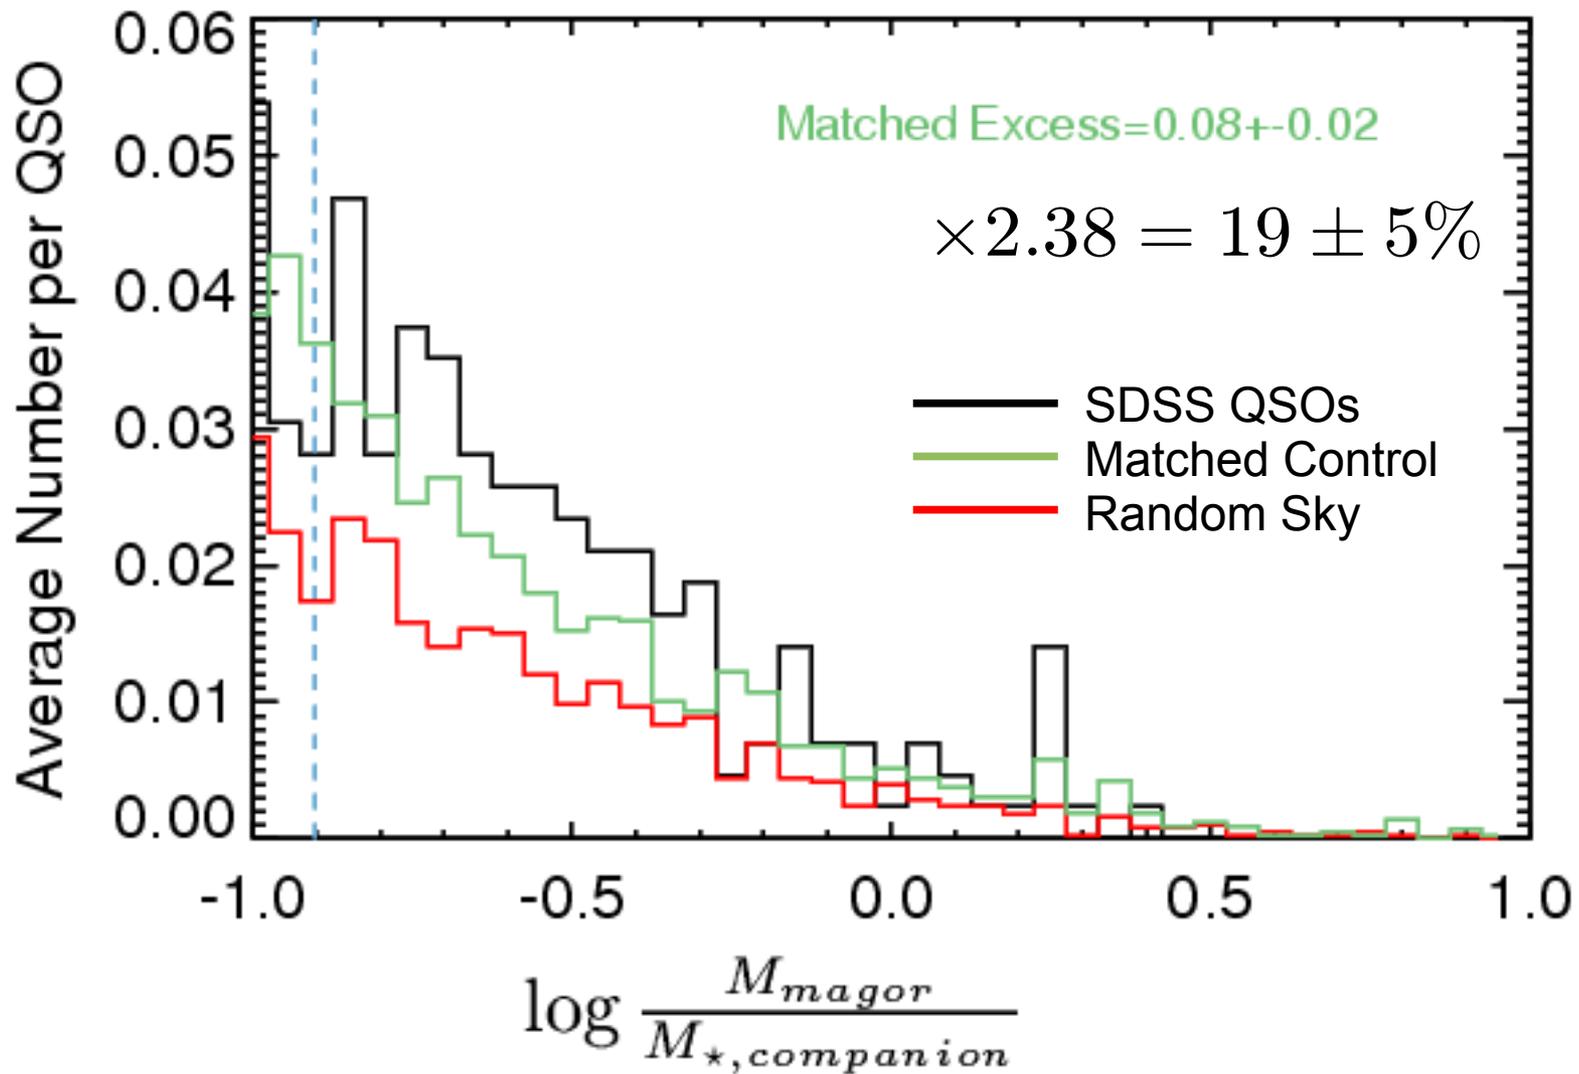

$$t_{qso} = 10 \text{ Myr}$$

$$\phi_{lag} = 250 \text{ Myr}$$

Future Work

- Study interacting pairs where one galaxy is in a quasar phase
 - Awaiting HST data from successful proposal to study morphologies of galaxies in same merger stage
- Search for more pairs with quasar photoionized extended tidal features
- Comparison of SMBH and galaxy masses at this intermediate stage will provide insights on evolution along the Magorrian relation

Summary

- Statistical study performed studying companions near $z < 0.2$ SDSS QSOs to determine which fraction of quasars are triggered during the first passage stage of a merger
- Determined a significant excess ($>8 \pm 2$ %) companions near quasars (30-80 kpc) interpreted as galaxies interacting with QSO hosts
- Used simulations to estimate a completion correction which increases fraction to $\sim 20\%$

Thank You

Perform the same experiment on two sets of control fields

- 1.) Empty Sky
- 2.) Mass-matched Control Sample
 - Magorrian Mass is not an ideal proxy for stellar mass (M_{magor})
 - compare luminosity functions in an interval of 1-1.2 Mpc
 - Find a factor of 2 correction

Expect the accurate background to be bracketed by these two cases
