 About DR7
 Sky Coverage
 Instruments
 Data Processing
 Algorithms

The Sloan Digital Sky Survey (see www.sdss.org) for general info of the entire sky and perform a redshift survey of galaxies. DR7 is the seventh major data release and provides images, fit parameters, and redshifts for download. It is the third and final data release of the original SDSS consisting of three subprojects: The LEGAL, the SDSS, and the SDSS.

About DR7 explains what is new in DR7, and lists remaining or planned improvements in the data.

Please refer to the [credits page](#) for our sources of funding, particularly to acknowledge the use of SDSS data in your publications. Also refer to SDSS sources in your publications using the proper IAU/SDSS sources.

ABOUT THE HEASARC RESOURCES FOR SCIENTISTS FAQ/HELP SITE MAP OTHER ARCHIVES

Guest Observer Facilities & Science Centers

The High Energy Astrophysics Science Archive Research Center (HEASARC) is the primary archive for NASA missions dealing with extremely energetic phenomena. From black holes to the Big Bang. Having recently merged with the Legacy Archive for Microwave Background Data Analysis (LAMBD), it includes data obtained by NASA's high-energy astronomy missions from the extreme ultraviolet through gamma-ray bands, along with missions that study the relic cosmic microwave background.

HEASARC Tip:
 The HEASARC has data from more than 24 missions, mostly in FITS format. Immediate online access to all our data and catalogs is available through our [Web Browser Service](#) and also via our EITP area.

WMAW Overview

The WMAW (Wilkinson Microwave Anisotropy Probe) mission is designed to determine the geometry, content, and evolution of the universe via a 13 arcminute FWHM resolution full sky map of the temperature anisotropy of the cosmic microwave background radiation. The choice of orbit, sky-scanning strategy and instrument/spacecraft design were driven by the goals of uncorrelated pixel noise, minimal systematic errors, multifrequency observations, and accurate calibration. The sky-map data products derived from the WMAW observations have 45 times the sensitivity and 33 times the angular resolution of the COBE DMR mission. The WMAW mission characteristics are summarized in the table below.

In the first release of WMAW data (February 2003), only the temperature data and analyses from the first year of operations at L2 were provided.

The SAO/NASA Astrophysics Data System

Welcome to the Digital Library for Physics and Astronomy

This site is hosted by the High Energy Astrophysics Division at the Harvard-Smithsonian Center for Astrophysics

Related Sites

The SAO/NASA Astrophysics Data System (ADS) is a Digital Library portal for researchers in Smithsonian Astrophysical Observatory (SAO) under a NASA grant. The ADS maintains three 7.5 million records: Astronomy and Astrophysics, Physics, and X-ray. The main body of records, which are searchable through highly customizable query forms, and full-text scans of manuscripts, are available via our full-text search interface. Integrated in the databases, the ADS provides external resources, including electronic articles, data catalogs and archives. We currently have the following external resources:

GA

Please note that all abstracts and articles in the ADS are copyrighted by the publisher. For more information, please read our page detailing the Terms and Conditions regarding the use of the ADS.

In addition to its databases, the ADS provides the [ADS Update Service](#), a free custom mailing list of the recent technical literature in astronomy and physics based on each individual subscriber's query. Service will scan the literature according to the ADS since the last update, and will create custom list formatted to allow quick reading and access. Subscribers are notified by e-mail in HTML format. A

Millennium Run Observatory

Overzier, GL etal 2012, arXiv:1206:6923

- Extend the Millennium Run project approach by producing data products directly corresponding to observations, namely synthetic images and extracted source catalogs
- Aid theorists in testing analytical models against observations
- Aid observers in making detailed predictions for observations and better analyses of observational data
- Allow the community to subject the models to new kinds of tests
- Allow observers and theorists to work toward each other from either direction with the freedom of where to meet.
- Allow detailed comparisons with synthetic observations produced by other groups performing cosmological simulations
- Allow calibration of observational analysis methods by making available synthetic data for which the entire underlying physical "reality" is known.
- Extend the realism with which semi-analytic models can address questions such as what is the probability that a $z \sim 10$ galaxy will be detected within a particular observational data set?
- Provide a framework for future virtual theoretical observatories

Millennium Run Observatory: Clusters: FOF Groups

Max-Planck-Institut für
Astrophysik

Clusters

- Particles cluster and collapse to groups/ halos/clusters.
- Many cluster finder algorithms
- All: cluster=group of particles
- Here:
FOF + SUBFIND
- See also lectures by
Risa and Peter

ISSAC 2012 SDSC, San Diego, USA

Friends-of-friends algorithm

Davis et al 1985

Linking length : 
 $b=0.2 \times$ mean inter-particle distance

Minimum # particles/group
 $N_{\min} = 20$

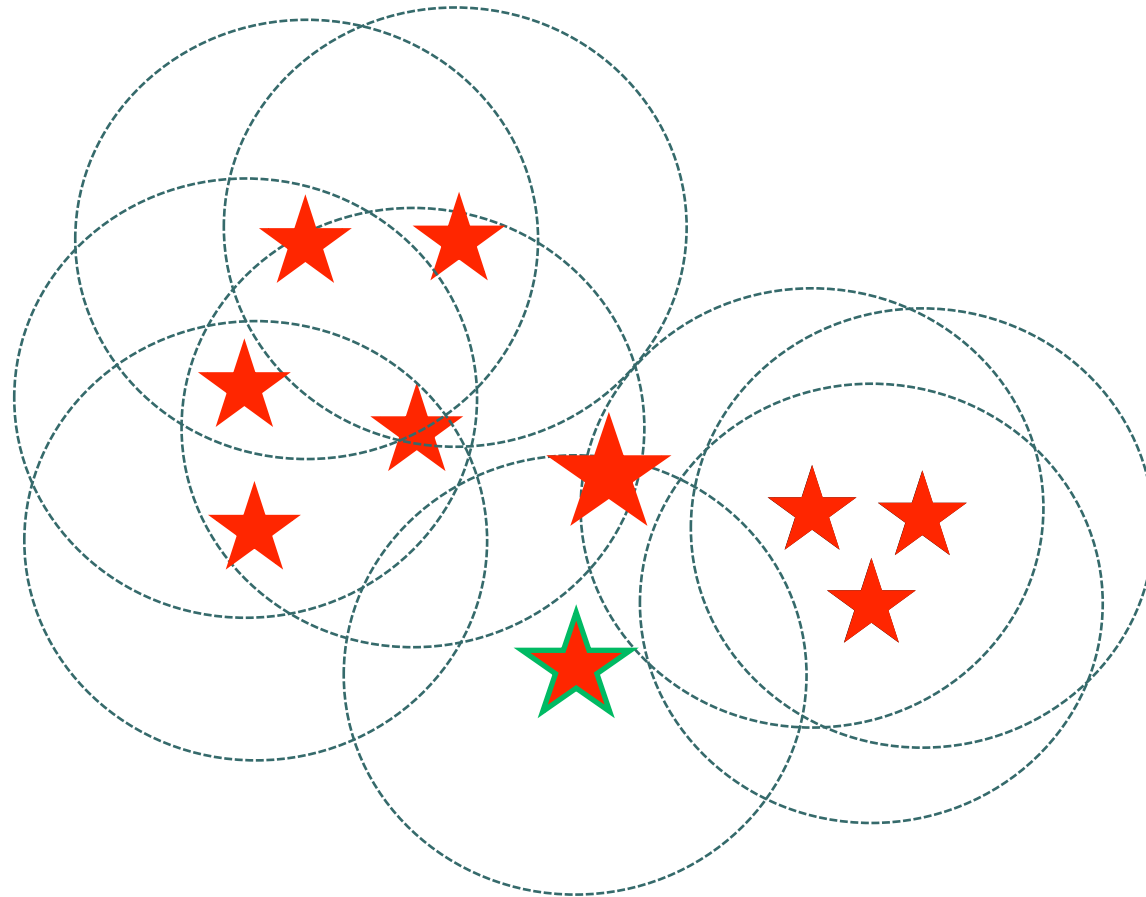

Max-Planck-Institut für
Astrophysik

FOF Groups, sometimes noisy

FOF groups have substructure

Detect sub-halos

- SUBFIND
 - Springel et al 2001
- One possible algorithm to detect sub-halos
 - See Risa/Peter for alternatives
- Gravitationally bound (more or less)
- Basis of semi-analytical galaxy modeling

SUBFIND algorithm: Selection of sub-halo candidates

slides courtesy Francesca Iannuzzi

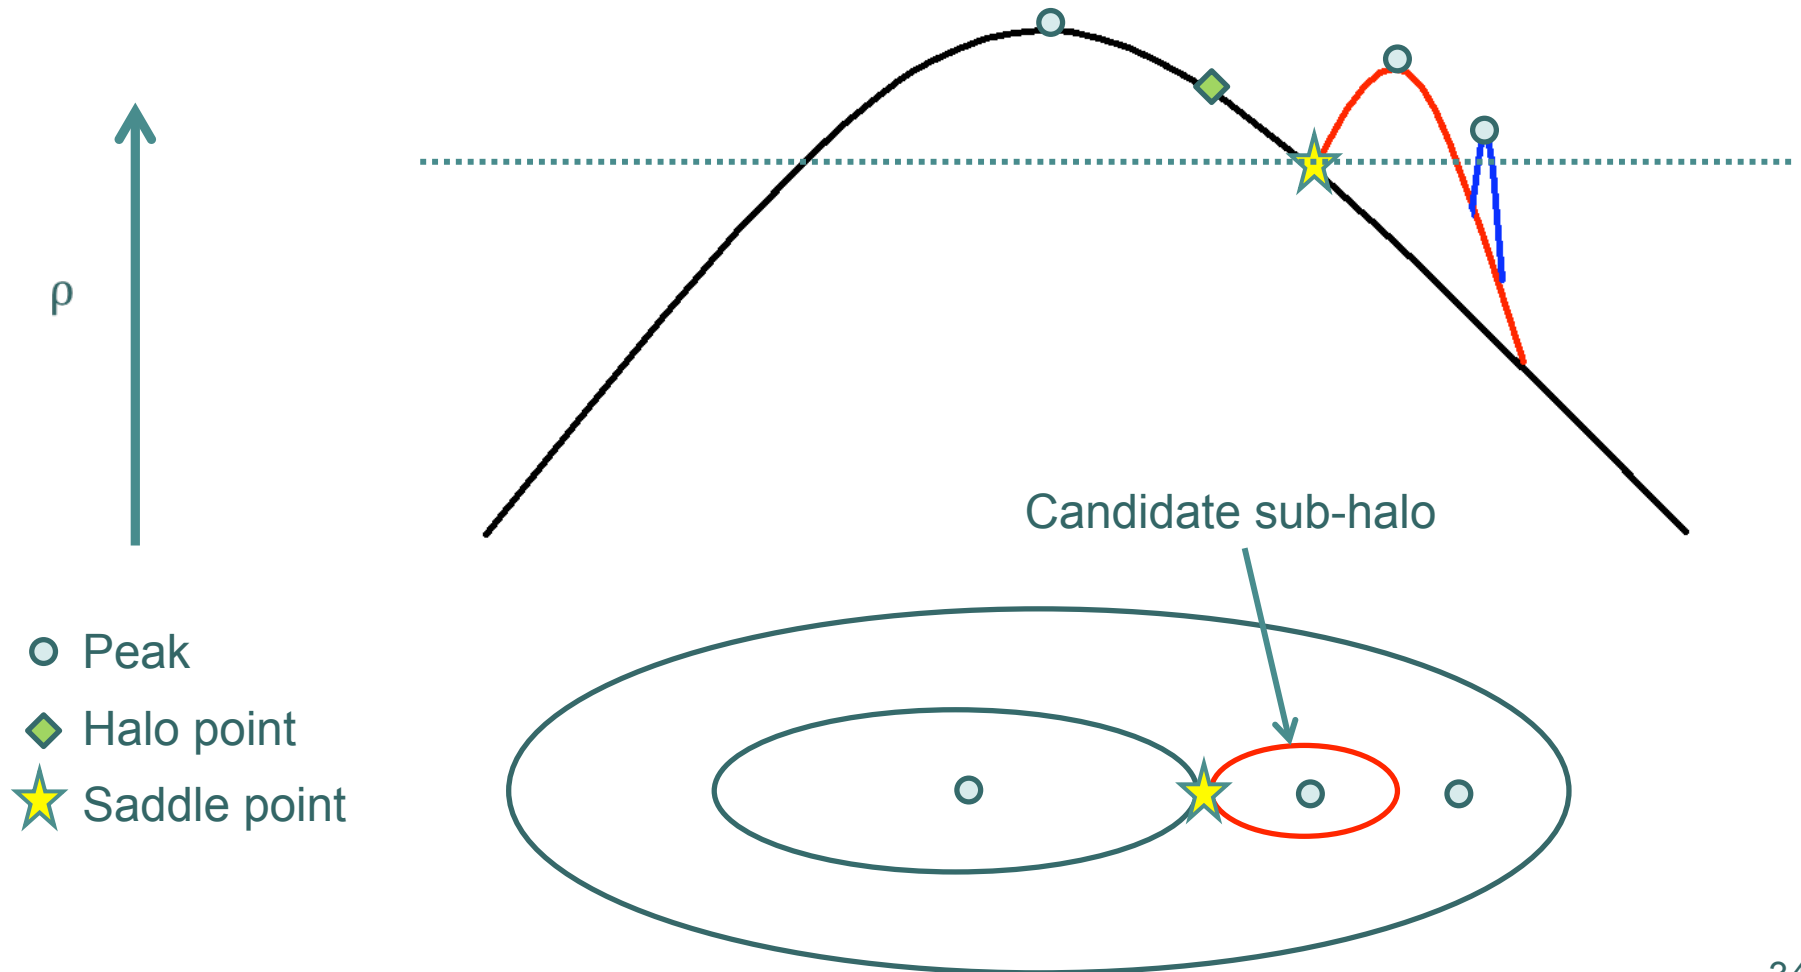

SUBFIND algorithm: Selection of sub-halo candidates

slides courtesy Francesca Iannuzzi

SUBFIND algorithm: Selection of sub-halo candidates

slides courtesy Francesca Iannuzzi

SUBFIND algorithm: Selection of sub-halo candidates

slides courtesy Francesca Iannuzzi

SUBFIND algorithm: Unbinding

- Process the candidates for self-boundedness
- For every particle compute:
 - potential energy (*positions in physical units*)
 - kinetic energy (*velocities wrt bulk velocity + Hubble flow, physical units*)
- Total energy $> 0 \Rightarrow$ particle removed from the candidate
 - Iteratively - no more than 1/4 of the particles removed at once

Millennium simulations

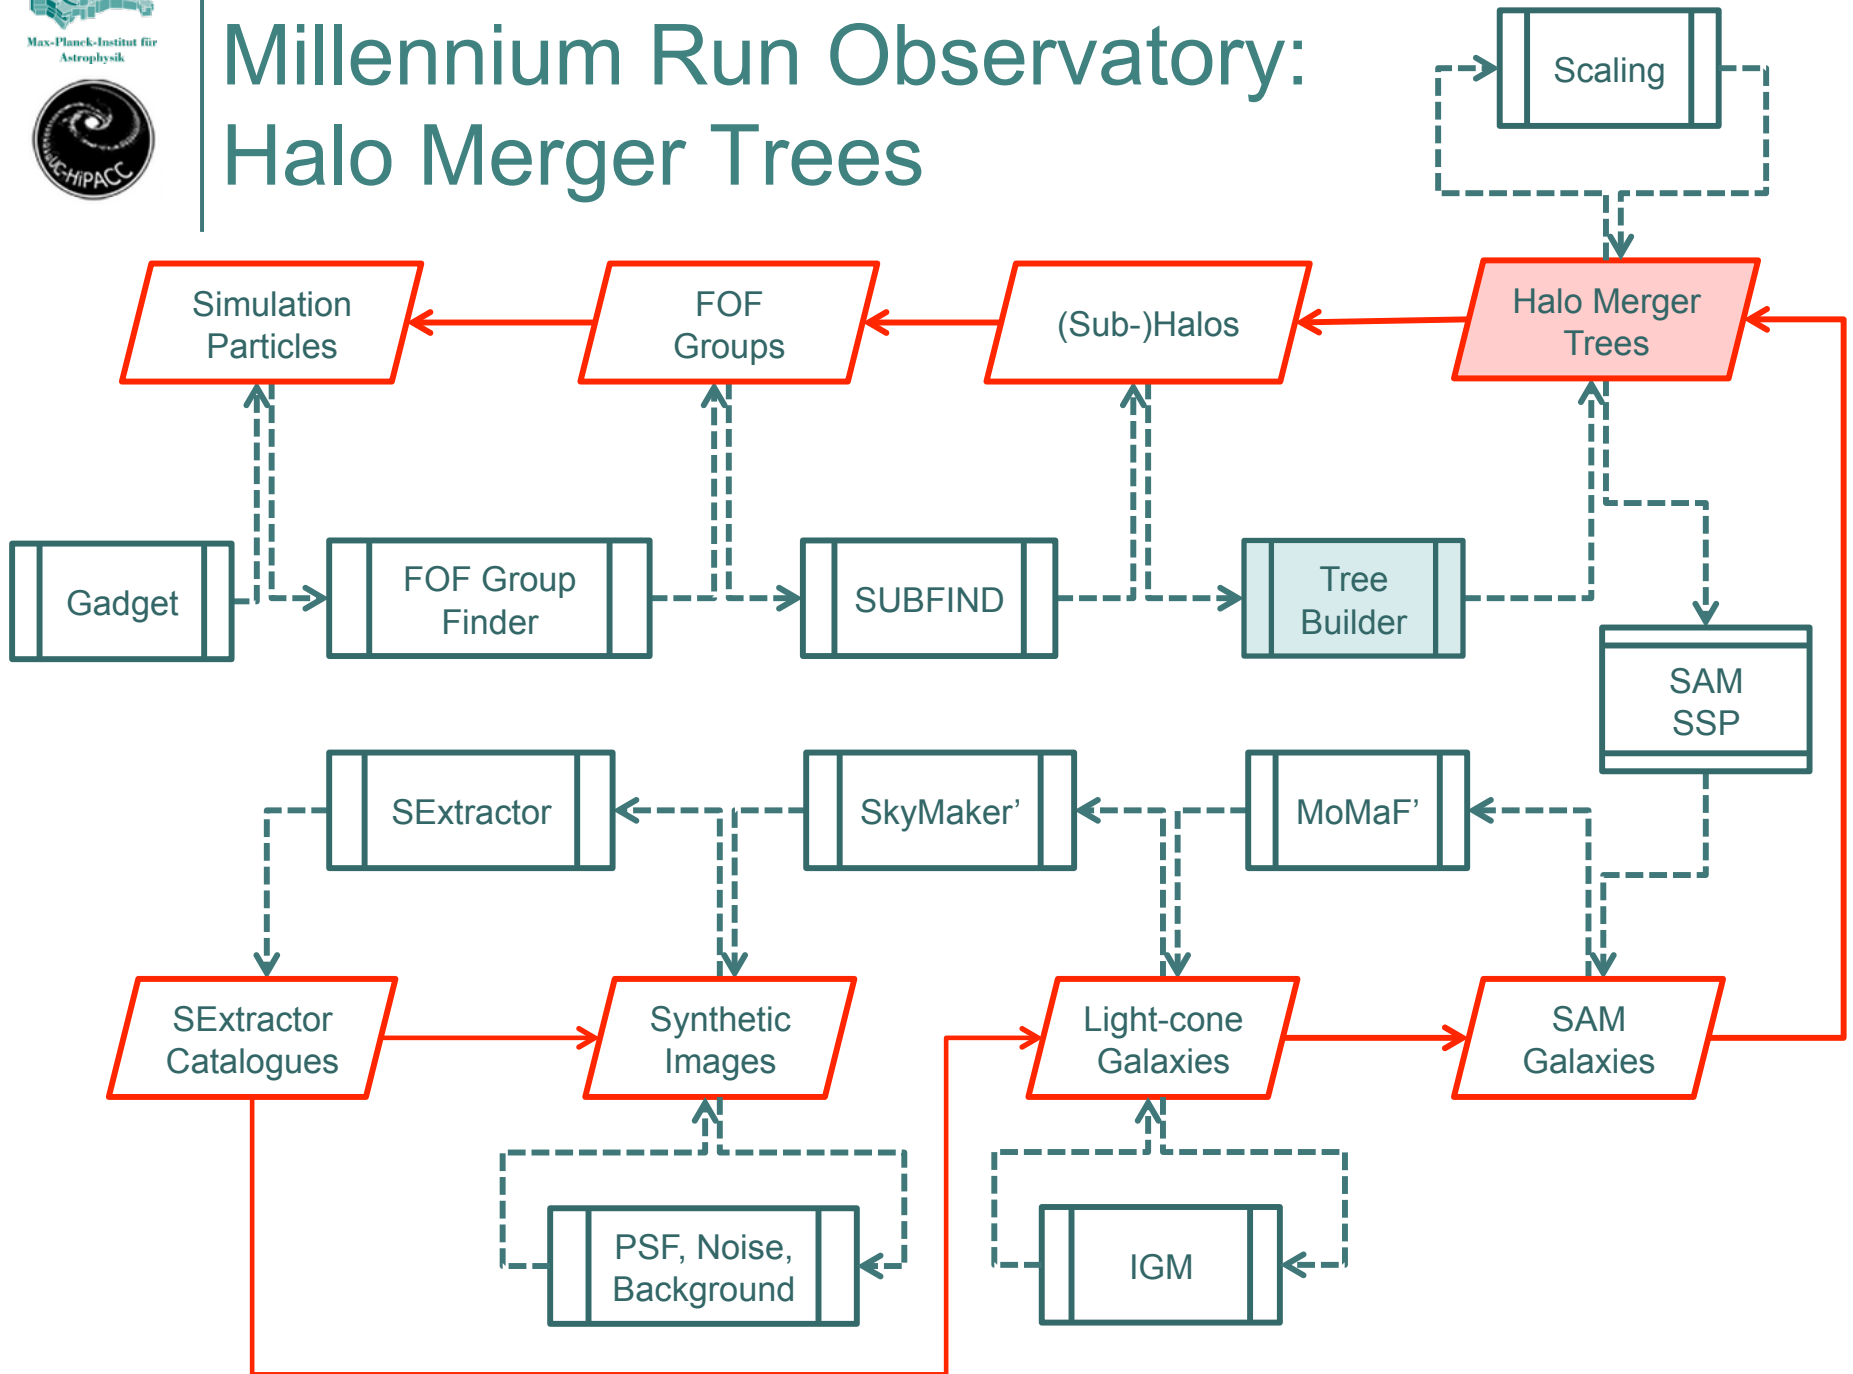

- Millennium
 - ~18 million/snapshot @ $z=0$
 - Total ~800 million
- Millennium-II
 - ~12 million @ $z=0$
 - Total ~680 million
- Millennium XXL @ $z=0$
 - FOF ~650 million
 - SH ~ 720 million

FOF multiplicity function, $z=0,1,2,3$

Millennium Run Observatory: Halo Merger Trees

(sub-)halo merger trees

- Evolution of halos:
 - Birth: first time a halo has ≥ 20 particles
 - Growth by
 - Accretion
 - Merging
 - Merge onto other halo
- Also
 - Dissolve
 - Get lost for a while (too close to other subhalo)
 - Are misidentified

Halo evolution: accretion and mergers

particles

halos

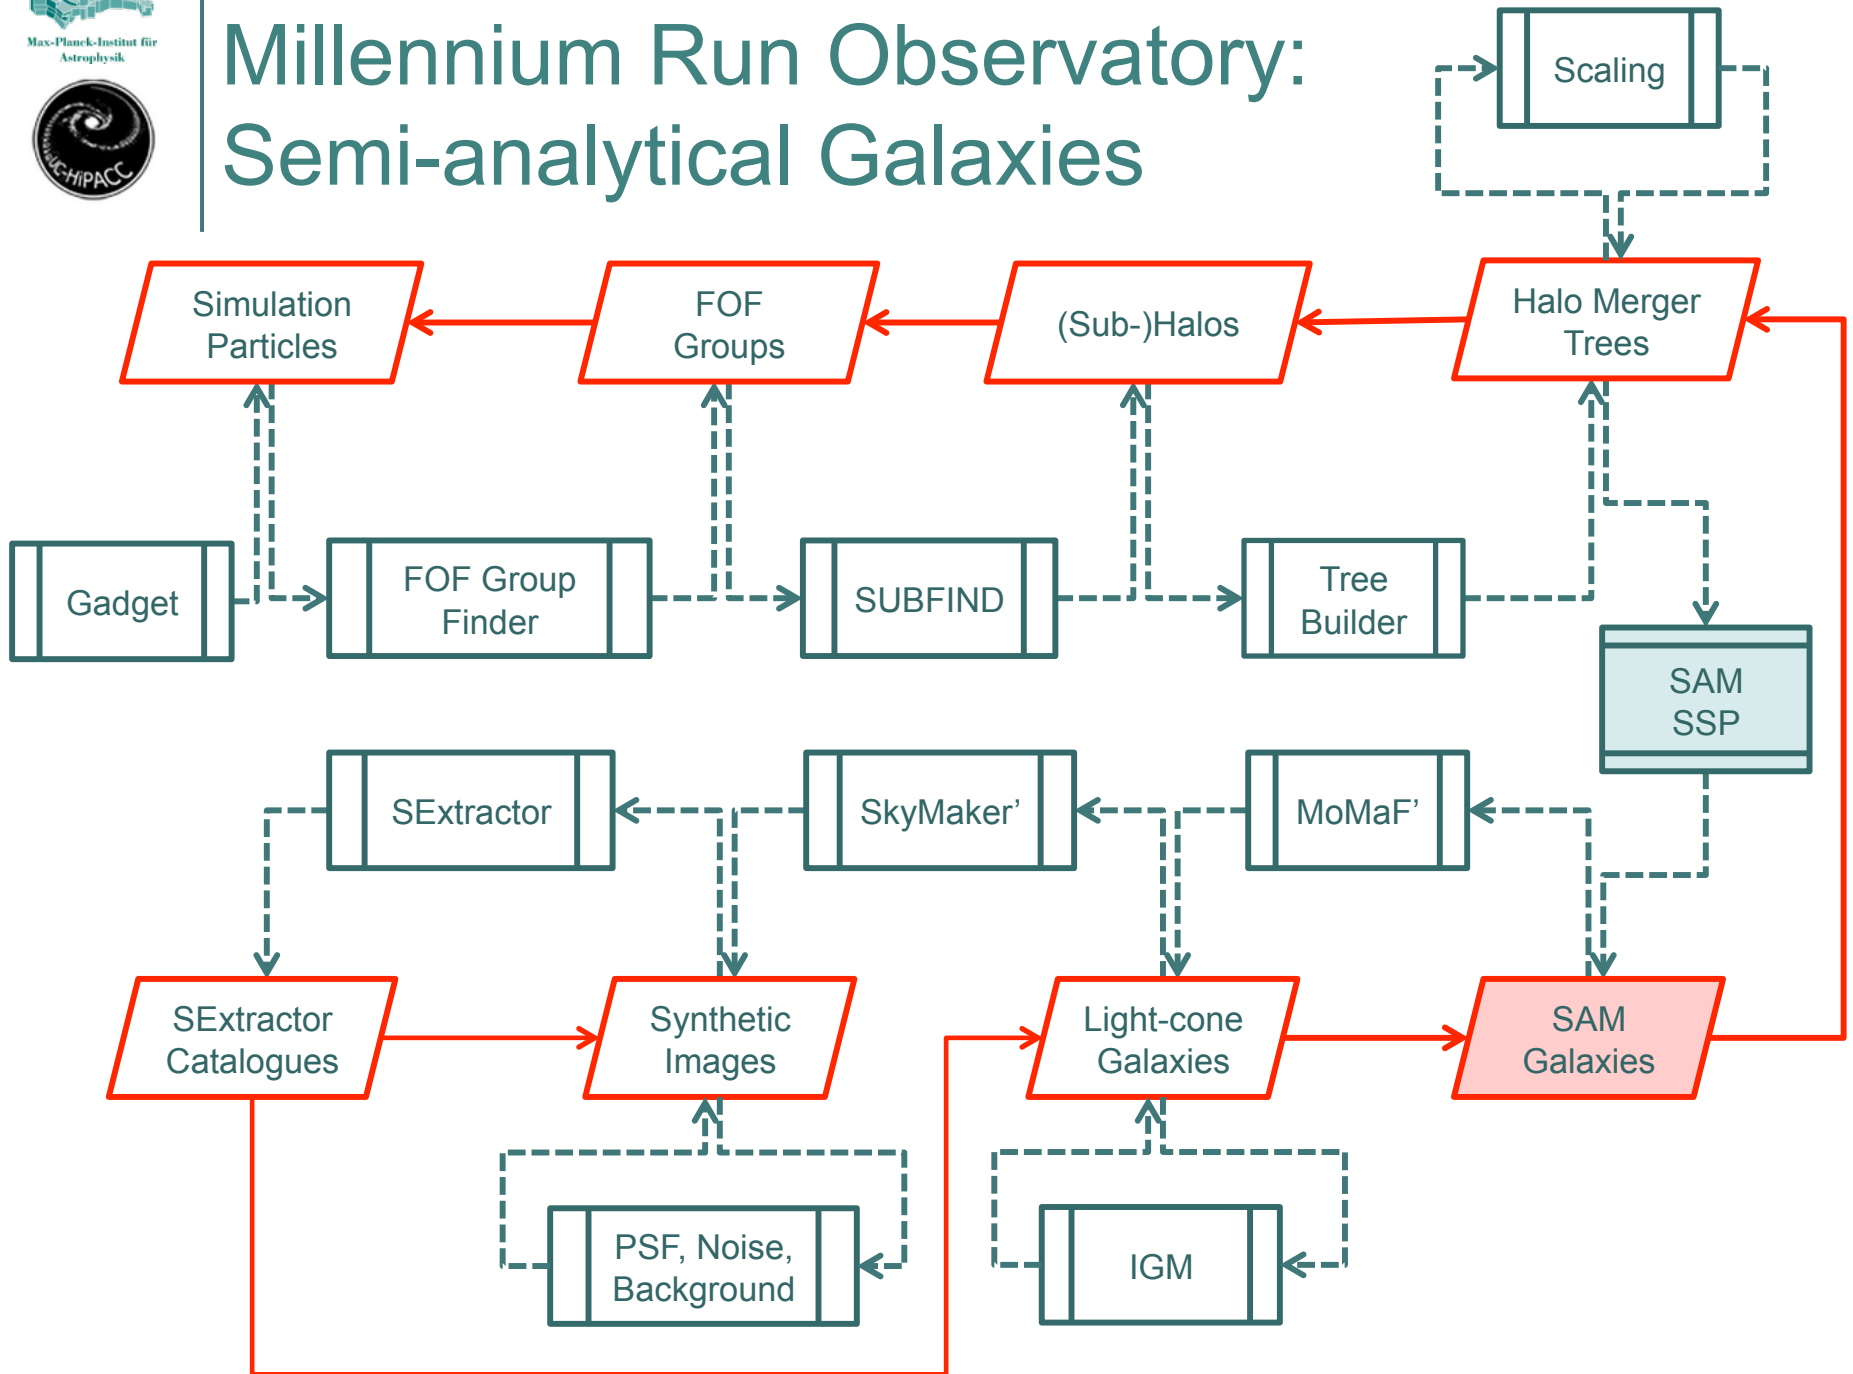

(see TOPCAT)

Table : mpahalotrees..mhalo
Halo ID = 4800002000000

Millennium Run Observatory: Semi-analytical Galaxies

Semi-analytical models for galaxy formation (SAMs)

- SAM:
 - Add baryonic physics *after* gravitational evolution on skeleton of halo merger trees
 - Advantage: can sample parameter space more efficiently
 - Disadvantage: no feedback baryonic physics on clustering.
- L-Galaxies: MPA's semi-analytical models (SAM) for galaxy formation
 - Others: Benson, Croton, Durham , GAlICS, Somerville, ... (etal)
- See lectures by Darren Croton for **all** the details

SAMs: baryons in halo merger trees

Table : mpahaltrees_mhalo
Halo ID = 4800002000000

Table : mpagalaxies_delucia2006a
Galaxy ID = 4800002000000

Table : mpagalaxies_delucia2006a
Galaxy ID = 415000584000000

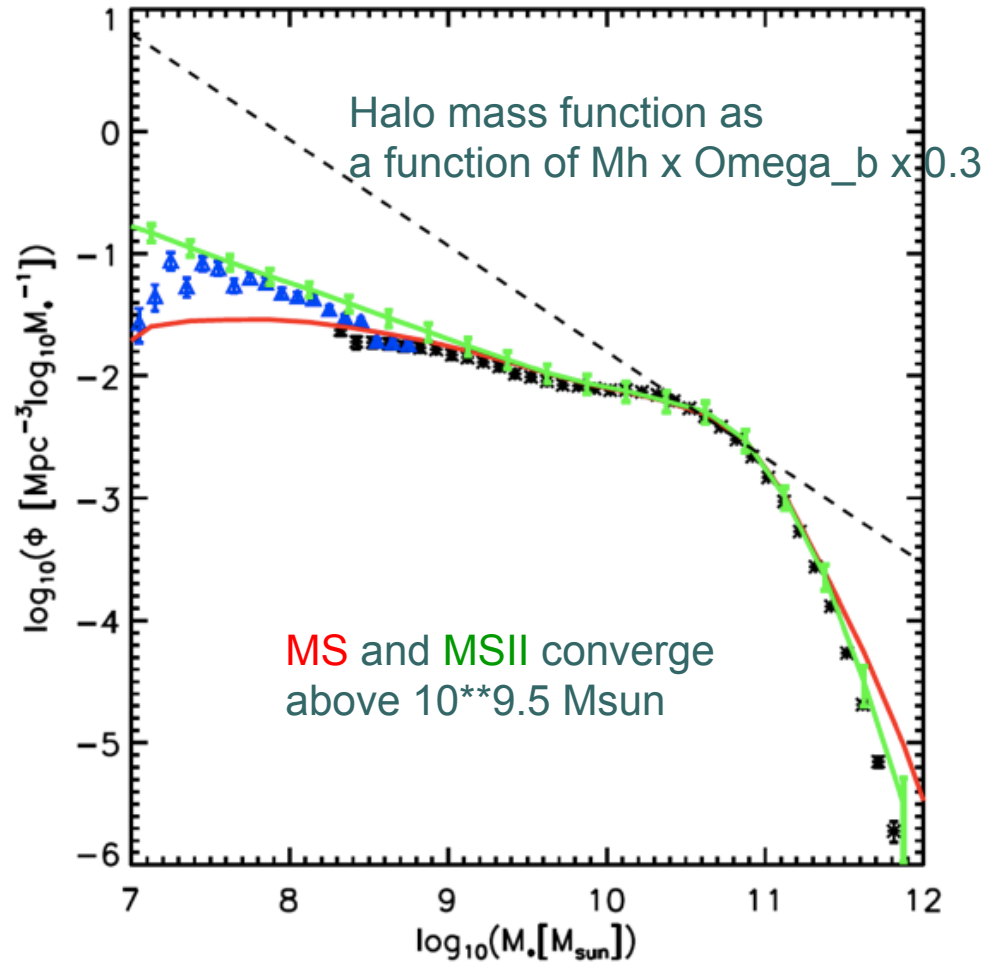

Halos \Rightarrow Galaxies

Latest models

DeLucia & Blaizot, 2006

Guo et al, 2011

Luminosity Functions

Correlation functions

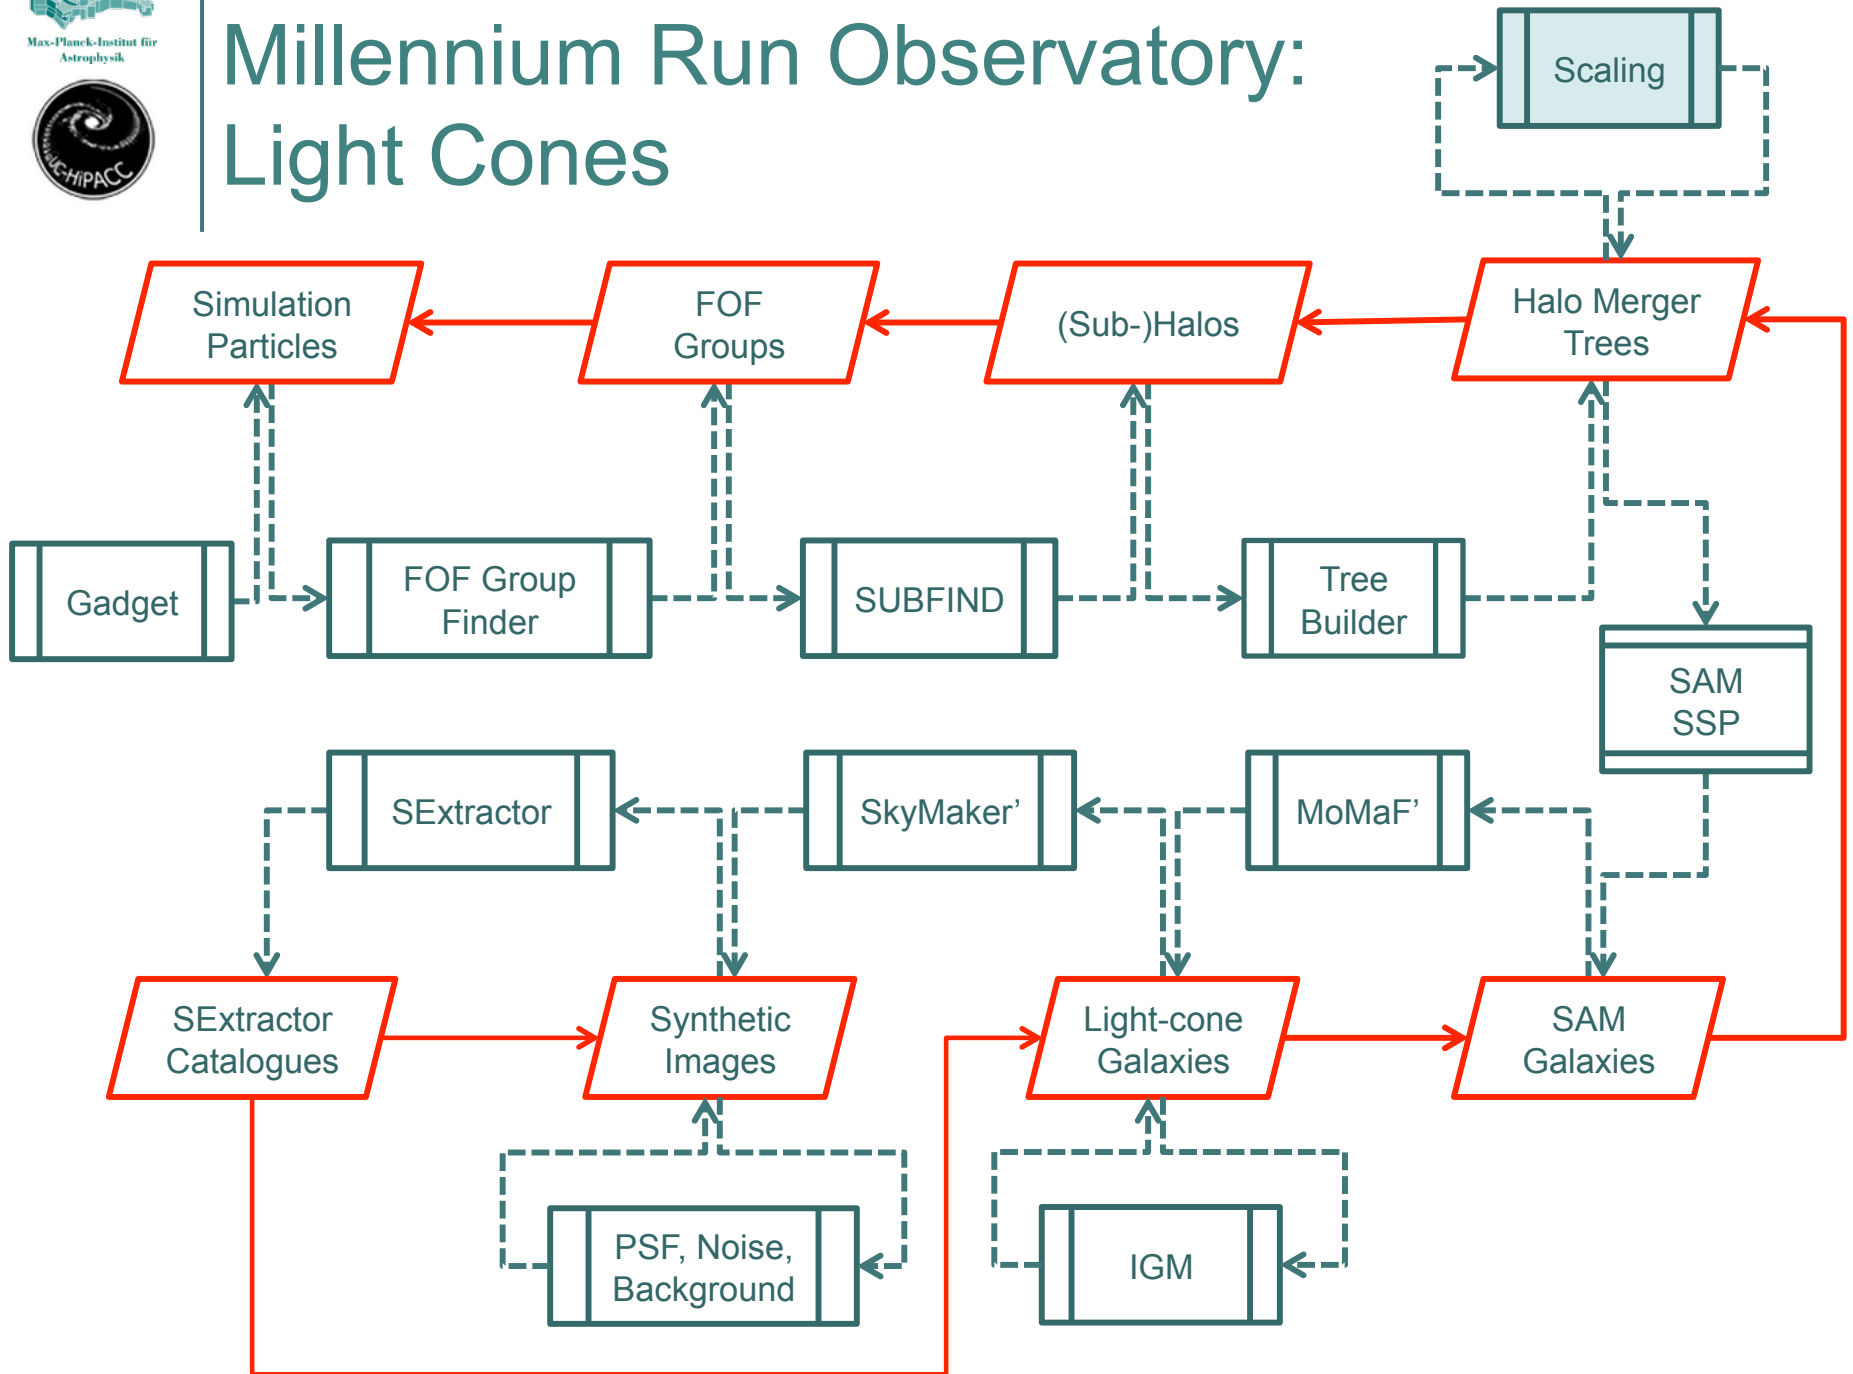

- Good convergence between MS and MSII
- Good fits at large scale → central galaxies are formed in the right halos.
- Excess at small scale → too many satellites? σ_8 (0.9) too big?

Wrong cosmology?

courtesy Qi Guo

Millennium Run Observatory: Light Cones

Alternative cosmologies: Scaling

- Beyond WMAP1
 - without needing new simulations
- Angulo & White (2010)
 - “One simulation to fit them all”
 - Use Millennium simulation
 - Scale size/mass/time to reproduce mass function/power spectrum of other cosmology
 - Use rescaled, retimed snapshots as input for SAM

Guo et al 2012 arXiv:12060052

Solid: WMAP 7
Dashed: WMAP 1
Red: MR
Green: MR-II
Purple: MR-WMAP7

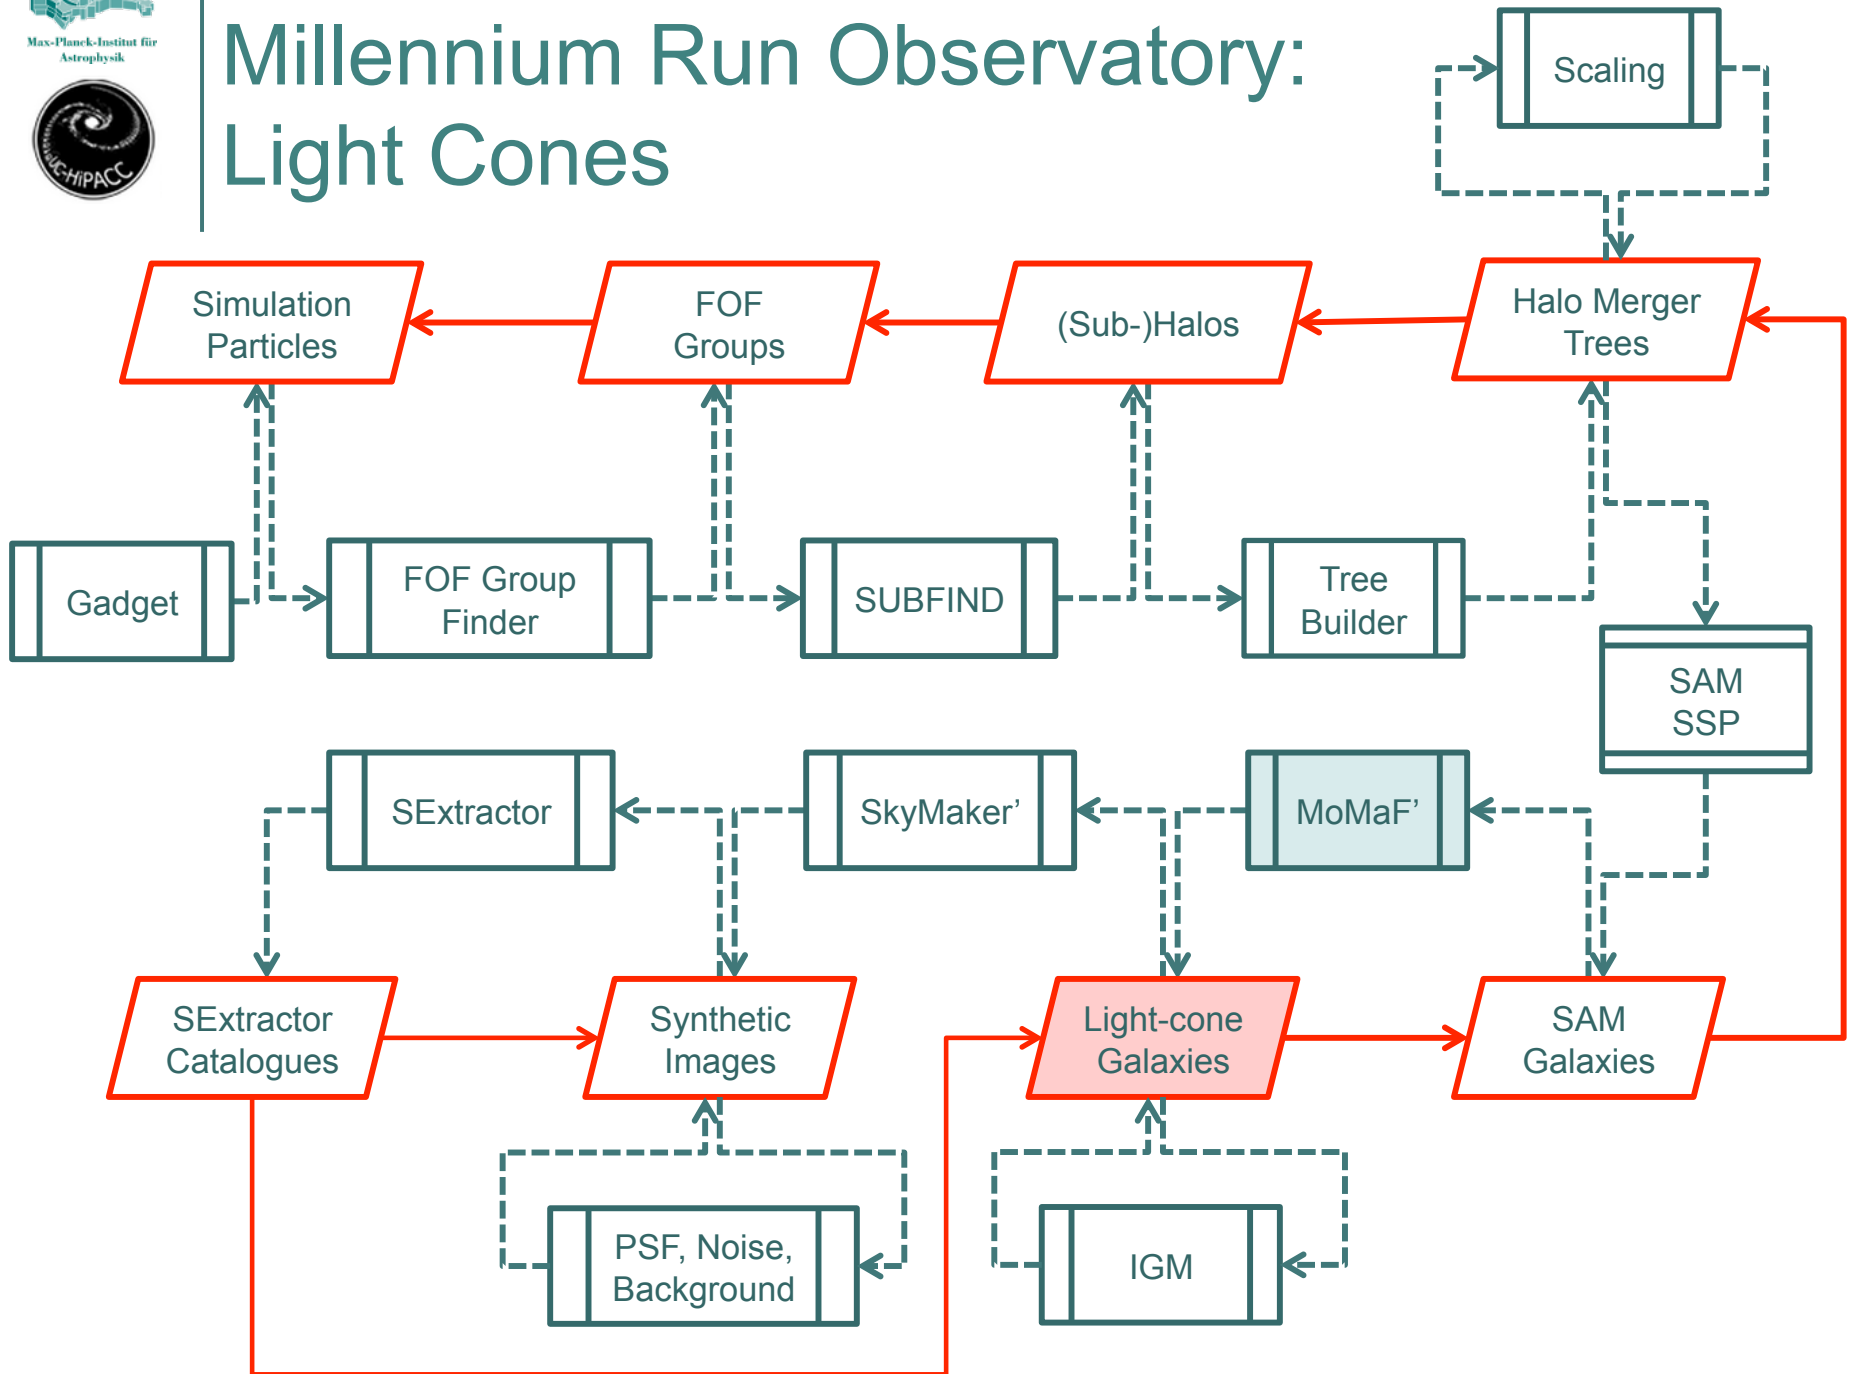

Correlation functions

Solid: MR
Dashed: MR-II
Red: WMAP1
Green: WMAP 7

Millennium Run Observatory: Light Cones

Light cones

- SAMs produce galaxies in snapshots
- To mimic real observations, need to produce “light cones”:
 - Observational properties: apparent magnitudes, sky positions, apparent redshifts, sizes, etc.
- Millennium box too small
 - Periodic replication needed
 - E.g. MoMaF, Blaizot et al 2005

Perspective effect
