## Nuclear reactions in the early

## universe II

Mark Paris - Los Alamos Nat'l Lab
Theoretical Division
ISSAC 2014 UCSD

## Organization

## Nuclear reactions in the early universe

$\square$ Lectures (Paris/E. Grohs)

- Overview of cosmology/Kinetic theory/Big bang nucleosynthesis (BBN)
II. Scattering \& reaction formalism/Neutrino energy transport
$\square$ Workshop sessions (E. Grohs/Paris)

1. BBN exercises: compute Nuclear Statistical Equilibrium/electron fraction
II. Compute primordial abundances vs $\Omega_{b} h^{2}$ : code parallelization
$\square$ Lecture notes
$\square$ Will be available online (URL TBA)

## Outline

Lecture I
$\square$ Overview
$\square$ Cosmological dynamics in GR
$\square$ Big bang nucleosynthesis (BBN)
$\square$ Boltzmann equation

- Flat \& curved spacetime

## Lecture II

$\square$ Unitary reaction network (URN) of light nuclei
$\square$ Neutrino energy transport
$\square$ Evan Grohs: observations of primordial abundances

## Light nuclear reaction program @ LANL

## Motivation

$\square$ Data sets: $\sigma, \sigma(\theta), A_{i}(\theta), C_{i, j}, K_{i}^{\prime}, \Sigma(\gamma), \ldots \rightarrow$ T matrix $\rightarrow$ resonance spectrum
$\square$ Unitary parametrization of compound nuclear system

- Applications: astrophysical, nuclear security, inertial confinement fusion, criticality safety, charge-particle transport, nuclear data (ENDF, ENSDF)
$\square$ Ab initio
- Variational MC; Green's function MC
- GFMC [PRL 99, 022502 (2007)]
- n - ${ }^{4} \mathrm{He}$ phase shifts
- comparison GFMC/R-matrix
$\square$ challenge: multichannel
- eg. $\mathrm{n} \alpha \rightarrow \mathrm{n} \alpha, \mathrm{n} \alpha \rightarrow \mathrm{dt} \& \mathrm{dt} \rightarrow \mathrm{dt}$
$\square$ Phenomenology
$\square \mathrm{R}$ matrix ( $2 \rightarrow 2$ body scatt/reacs)
- 3-body channels being incorporated

## EDA Analyses of Light Systems

| A | System | Channels | Energy Range ( MeV ) |
| :---: | :---: | :---: | :---: |
| 2 | $\mathrm{N}-\mathrm{N}$ | $\begin{aligned} & p+p ; n+p, \\ & \gamma+d \end{aligned}$ | $\begin{aligned} & 0-30 \\ & 0-40 \end{aligned}$ |
| 3 | N -d | $p+d ; n+d$ | 0-4 |
|  | $\begin{aligned} & { }^{4} \mathrm{H} \\ & { }^{4} \mathrm{Li} \end{aligned}$ | $\begin{aligned} & n+t \\ & p+{ }^{3} \mathrm{He} \end{aligned}$ | 0-20 |
| 4 | ${ }^{4} \mathrm{He}$ | $\begin{aligned} & p+t \\ & n+{ }^{3} \mathrm{He} \\ & d+d \end{aligned}$ | $\begin{aligned} & 0-11 \\ & 0-10 \\ & 0-10 \end{aligned}$ |
| 5 | ${ }^{5} \mathrm{He}$ | $\begin{aligned} & n+\alpha \\ & d+t \\ & { }^{5} \mathrm{He}+\gamma \end{aligned}$ | $\begin{aligned} & 0-28 \\ & 0-10 \end{aligned}$ |
|  | ${ }^{5} \mathrm{Li}$ | $\begin{aligned} & p+\alpha \\ & d+{ }^{3} \mathrm{He} \end{aligned}$ | $\begin{aligned} & 0-24 \\ & 0-1.4 \end{aligned}$ |

Analyses of Light Systems, Cont.

| A | System (Channels) |

${ }^{13,14} \mathrm{C}$ system analyses: $\sigma_{\mathrm{T}}(\mathrm{b})$ vs. $\mathrm{E}_{\mathrm{n}}(\mathrm{MeV})$
$\mathrm{n}+{ }^{12} \mathrm{C}$ Total Cross Section

Analyses by GMH/MWP
${ }^{12} C(n, n ')$ Cross Section

Two-channel analysis
n+ ${ }^{13}$ C Total Cross Section

Single-channel analysis

## Unitary, self-consistent primordial nucleosynthesis

$\square$ State of standard big-bang nucleosynthesis (BBN)
$\square$ d \& ${ }^{4} \mathrm{He}$ abundances: signature success cosmology+nucl astro+astroparticle

- but there's at least one Lithium ( $\left.{ }^{7} \mathrm{Li}\right)$ Problem [ ${ }^{6} \mathrm{Li}$ too? See: Lind et.al. 2013]
$\square$ coming precision observations of $d,{ }^{4} \mathrm{He}, \eta, N_{\text {eff }}$ demand new BBN capabilities
- resolution of ${ }^{7}$ Li problem:
- observational/stellar astrophysics?

■ ${ }^{7} \mathrm{Li}$ controversial anomaly: nuclear physics solution?

- new physics?
$\square$ Advance BBN as a tool for precision cosmology
- incorporate unitarity into strong \& electroweak interactions (next slide)
- couple unitary reaction network (URN) to full Boltzmann transport code
- neutrino energy distribution function evolution/transport code
- fully coupled to nuclear reaction network
- calculate light primordial element abundance for non-standard BBN
- active-sterile $\nu$ mixing
- massive particle out-of-equilibrium decays $\rightarrow$ energetic active SM particles
- Produce tools/codes for nuc-astro-particle community: test new physics w/BBN
- existing codes are based on Wagoner's (1969) code

## Nuclear reaction network

$\square$ Single-process (non-unitary) analysis

- $\sigma_{\alpha \beta}(\mathrm{E}) \pm \delta \sigma_{\alpha \beta}(\mathrm{E})$ from expt
- fit form (non-res+narrow res) to $\sigma_{\alpha \beta}(\mathrm{E})$
- compute $\langle\sigma v\rangle(T) \rightarrow$ reactivity $\rightarrow$ network
- NB: norm. systematics can be large
- ${ }^{17} \mathrm{O}$ case (below)
$\square$ Multi-channel (unitary) analysis
- Construct unitary parametrization
- R-matrix (Wigner-Eisenbud '47)
- simultaneous fit of unpolarized/pol'd scatt/reac data $\rightarrow$ determine $T$ (or S)matrix
- determines a unitary reaction network (URN) for analyzed compound systems

Wagoner ApJSuppl ‘69

## Boltzmann eq., cross sections, thermal averages

$\square$ Boltzmann equation
$\square$ Toy model, single reaction $\rightarrow \frac{1}{a^{3}} \frac{d\left(n_{1} a^{3}\right)}{d t}=-\langle\sigma v\rangle\left\{n_{1} n_{2}-n_{3} n_{4} \frac{n_{1}^{(0)} n_{2}^{(0)}}{n_{3}^{(0)} n_{4}^{(0)}}\right\}$

- Full code has 144 reactions
- Thermal (Maxwellian) averaged flux(v)*cross section

$$
\langle\sigma v\rangle=\left(\frac{8}{\pi \mu}\right)^{1 / 2}\left(\frac{1}{k T}\right)^{3 / 2} \int_{0}^{\infty} d E E \sigma_{12 \rightarrow 34}(E) e^{-E / k T}
$$

$\square$ Energy dependent, angle-integrated cross section is determined from data; Ranking worst $\rightarrow$ best:
$\square$ Guess: sometimes necessary when no data/calc. (e.g. TALYS)

- Parametrize resonance data: undesirable since res/non-res related by unitarity; results in model dependent reaction cross section
- Fit to experimental cross section: can be OK; normalization often problematic; subject to sometimes large systematic uncertainty
- Unitary theory: multichannel R-matrix: sure-fire; downside: need multichannel data

## Observables from transition (T) matrix

$\square$ Scattering matrix: QM amplitude for (i)nitial $\rightarrow$ (f)inal

$$
\langle\mathrm{f}| S(E)|\mathrm{i}\rangle=\delta_{f i}+2 i T_{f i}(E)
$$

$\square$ All observables $\sim T$ matrix bilinears

- unpolarized differential cross section

$$
\frac{d \sigma_{f i}}{d \Omega}=\frac{4 \pi}{k^{2}} \frac{1}{N_{s p i n s, i}} \sum_{s p i n s, f}\left|T_{f i}\right|^{2}
$$

- polarization asymmetry

$$
P=\frac{\sigma_{\uparrow \uparrow}-\sigma_{\downarrow \uparrow}}{\sigma_{\uparrow \uparrow}+\sigma_{\downarrow \uparrow}}
$$

$\square$ Diff cross section $\rightarrow$ int'd cross section $\rightarrow$ thermal averaged

$$
\sigma(E)=\int d \Omega \frac{d \sigma}{d \Omega} \rightarrow\langle\sigma v\rangle
$$

## Unitarity: consequences on T matrix

$$
\left.\begin{array}{cc}
\delta_{f i} & =\sum_{n} S_{f n}^{\dagger} S_{n i} \\
S_{f i} & =\delta_{f i}+2 i \rho_{f} T_{f i} \\
\rho_{n} & =\delta\left(H_{0}-E_{n}\right)
\end{array}\right\} \quad T_{f i}-T_{f i}^{\dagger}=2 i \sum_{n} T_{f n}^{\dagger} \rho_{n} T_{n i}
$$

NB: unitarity implies optical theorem $\sigma_{\text {tot }}=\frac{4 \pi}{k} \operatorname{Im} f(0)$; but not only the O.T.

## - Implications of unitarity constraint on transition matrix

1. Doesn't uniquely determine $\mathrm{T}_{\mathrm{ij}}$; highly restrictive, however

Elastic: $\operatorname{Im} T_{11}^{-1}=-\rho_{1}$ (assuming $\mathrm{T} \& \mathrm{P}$ invariance)
Multichannel: $\operatorname{Im} \mathbf{T}^{-1}=-\rho$
2. Unitarity violating transformations

- cannot scale any set:
- cannot rotate any set: $\quad T_{i j} \rightarrow e^{i \theta_{i j}} T_{i j} \quad \theta_{i j} \in \mathbb{R}$
$\star$ consequence of linear 'LHS' $\propto$ quadratic 'RHS'

Most important feature: linear ~ quadratic
3. Unitary parametrizations constrain the experimental data itself

* normalization, in particular
$\star$ case studies: ${ }^{17} \mathrm{O} \&{ }^{9} \mathrm{~B}$ compound system

## Basics of R-matrix (data $\Rightarrow$ amplitudes)

$\square$ Assumptions (cf. Lane \& Thomas RMP ‘58)
a) Non-relativistic QM (L\&T58); LANL-EDA uses rel.
b) Two-body channels only ('c'); aux. spectra code
c) Conservation of $N, \mathbf{Z}$
d) Finite radius $a_{c}$ beyond $V_{\text {pol }} \approx 0$; sharp boundaries
$\square$ Separated pairs, "channels"
$\square$ A nucleons $\rightarrow\left(\mathrm{A}_{1}, \mathrm{~A}_{2}\right)$
$\square c=\left\{\alpha s_{1} m_{1} s_{2} m_{2}\right\} \rightarrow\left\{\alpha\left(s_{1} s_{2}\right) s m_{s} l m_{\ell}\right\} \rightarrow\left\{\alpha\left(s_{1} s_{2}\right) s \ell, J M\right\}$
$\square$ Assume $a_{c}=a_{\alpha} \rightarrow$ many $c$ have same channel in
 configuration space
Channel surface

- Consider configuration space of 3A dimensions
- Set of points: $\cup_{c} r_{\alpha(c)}=a_{\alpha(c)}$
- Surfaces coincide but assumed to have negl. prob.
- Channels are cylinders normal to channel surf.
$\mathrm{Li}^{7}+p \rightarrow \mathrm{Be}^{8 *} \rightarrow\left\{\begin{array}{l}\mathrm{Li}^{7}+p \text { (elastic scattering) } \\ \mathrm{Li}^{7 *}+p^{\prime} \text { (inelastic scattering) } \\ \mathrm{Be}^{7}+n \\ \mathrm{Li}^{6}+d \\ \mathrm{He}^{4}+\mathrm{He}^{4} \\ \mathrm{Be}^{8}+\text { photon, etc. (capture) }\end{array}\right.$

## R-matrix formalism

$\left.\mathcal{L}_{B}=\sum_{c} \mid c\right)\left(c \left\lvert\,\left(\frac{\partial}{\partial r_{c}} r_{c}-B_{c}\right)\right.\right.$,
$\left(\mathbf{r}_{c} \mid c\right)=\frac{\hbar}{\sqrt{2 \mu_{c} a_{c}}} \frac{\delta\left(r_{c}-a_{c}\right)}{r_{c}}\left[\left(\phi_{s_{1}}^{\mu_{1}} \otimes \phi_{s_{2}}^{\mu_{2}}\right)_{s}^{\mu} \otimes Y_{l}^{m}\left(\hat{\mathbf{r}}_{c}\right)\right]_{J}^{M}$
$R_{c^{\prime} c}=\left(c^{\prime}\left|\left(H+\mathcal{L}_{B}-E\right)^{-1}\right| c\right)=\sum_{\lambda} \frac{\left(c^{\prime} \mid \lambda\right)(\lambda \mid c)}{E_{\lambda}-E}$

Bloch operator $\left.\mathcal{L}_{B}=\sum_{c} \mid c\right)\left(c \left\lvert\,\left[\frac{\partial}{\partial r_{c}} r_{c}-B_{c}\right]\right.\right.$ ensures
Hermiticity of Hamiltonian restricted to internal region
$\square$ R-matrix theory: unitary, multichannel parametrization of (not just resonance) data
$\square$ Interior/Exterior regions

- Interior: strong interactions
- Exterior: Coulomb/nonpolarizing interactions
- Channel surface
$\mathcal{S}_{c}: r_{c}=a_{c} \quad \mathcal{S}=\sum_{c} \mathcal{S}_{c}$
$\square$ R-matrix elements
- Projections on channel surface functions ( $\mathbf{r}_{c} \mid c$ ) of Green's function

$$
G_{B}=\left[H+\mathcal{L}_{B}-E\right]^{-1}
$$

- Boundary conditions

$$
B_{c}=\left.\frac{1}{u_{c}\left(a_{c}\right)} \frac{d u_{c}}{d r_{c}}\right|_{r_{c}=a_{c}}
$$

## R-matrix implementation in EDA

EDA = Energy Dependent Analysis
$\square$ Adjust $E_{\lambda} \& \gamma_{c \lambda}$
$\square$ Any number of two-body channels
$\square$ Arbitrary spins, masses, charges (zero mass)
$\square$ Scattering observables
$\square$ Wolfenstein trace formalism
Data
$\square$ Normalization
$\square$ Energy shifts
$\square$ Energy resolution/spread
$\square$ Fit (rank-1 var. metric) solution

$$
\chi_{E D A}^{2}=\sum_{i}\left[\frac{n X_{i}(\mathbf{p})-R_{i}}{\delta R_{i}}\right]^{2}+\left[\frac{n S-1}{\delta S / S}\right]^{2}
$$

$\square$ Covariance determined

## ${ }^{17} \mathrm{O}$ analysis configuration

|  | Channel | $a_{c}(\mathrm{fm})$ | $I_{\text {max }}$ |
| :---: | :---: | :---: | :---: |
|  | $\mathrm{n}+{ }^{16} \mathrm{O}$ | 4.3 | 4 |
|  | $\alpha+{ }^{13} \mathrm{C}$ | 5.4 | 5 |
| Reaction | Energies (MeV) | \# data points | s Data types |
| ${ }^{16} \mathrm{O}(\mathrm{n}, \mathrm{n})^{16} \mathrm{O}$ | $E_{n}=0-7$ | 2718 | $\sigma_{\mathrm{T}}, \sigma(\theta), \mathrm{P}_{\mathrm{n}}(\theta)$ |
| ${ }^{16} \mathrm{O}(\mathrm{n}, \alpha)^{13} \mathrm{C}$ | $E_{n}=2.35-5$ | 5850 | $\sigma_{\text {int }}, \sigma(\theta), A_{n}(\theta)$ |
| ${ }^{13} \mathrm{C}(\alpha, n)^{16} \mathrm{O}$ | $\mathrm{E}_{\alpha}=0-5.4$ | 874 | $4 \mathrm{O}_{\text {int }}$ |
| ${ }^{13} \mathrm{C}(\alpha, \alpha)^{13} \mathrm{C}$ | $\mathrm{E}_{\alpha}=2-5.7$ | 1296 | 6 - $\sigma(\theta)$ |
| total |  | 5738 | 8 |

## ${ }^{17}$ O compound system: experimental status

## Recent (Harissopulos '05) measurement ${ }^{13} \mathrm{C}(\alpha, n){ }^{16} \mathrm{O}$ vs. older (Bair \& Haas '73)

Heil et.al. PRC 78025803 ('08)

Harissopulos(05) data $2 / 3 * \mathrm{~B} \& \mathrm{H}(73)$
Heil(08) data consistent with B\&H

Tempting to conclude that B\&H73 was right all along!

## ${ }^{17} \mathrm{O}$ compound system: experimental status

Tempting to conclude that B\&H73 was right all along!

## R-matrix analyses support B\&H73/Heil08

$\square$ LANL R-matrix fit to Bair\&Haas73
a two-channel fit: $\left({ }^{16} \mathrm{O}, \mathrm{n}\right) \&\left({ }^{13} \mathrm{C}, \alpha\right)$
$\square \ell_{n}=0, \ldots, 4 ; \quad \ell_{\alpha}=0, \ldots, 5$
$\square$ data included: $\sigma_{T}(E)$
${ }^{16} \mathrm{O}(\mathrm{n}, \mathrm{n}),{ }^{16} \mathrm{O}(\mathrm{n}, \alpha),{ }^{13} \mathrm{C}(\alpha, \mathrm{n})$

- $\sigma_{e l}, d \sigma / d \Omega, A_{y}$
- $\chi^{2}$ min: normalizations float
- Test Hariss05 data
- remove B\&H73/HeilO8 data

- fix Hariss05 norm to unity
- unable to obtain fit $\chi^{2}(<2.0)$
- now allow HarissO5 norm to float
- requires scale factor of $\sim 1.5$, consistent with B\&H73
$\square$ Kunieda/Kawano analysis [2013]
- cf. LANL R-matrix(EDA)/ENDF/B-VI. 8
$\square$ with independent $R$-matrix code
$\square$ Right to conclude B\&H73 data correct on the basis of unitarity!

## Toward a unitary reaction network for BBN

$\square$ Primordial nucleosynthesis

- Can unitarity play a role in precision BBN?
$\square \mathrm{D},{ }^{4} \mathrm{He}$ abund. agree with theo/expl uncertainties
$\square$ At $\eta_{\text {wmap }}(C M B)^{7} \mathrm{Li} /\left.\mathrm{H}\right|_{\text {BBN }} \sim(2.2-4.2)^{* 7} \mathrm{Li} /\left.\mathrm{H}\right|_{\text {halo* }}$
$\square$ Discrepancy ~4.5-5.5 $\sigma \rightarrow$ the "Li problem"
$\square$ Resonant destruction ${ }^{7} \mathrm{Li}$
- Prod. mass 7 "well understood"; destruction not
- Cyburt \& Pospelov arXiv:0906.4373; IJMPE, 27 (2012)

$\square{ }^{7} \mathrm{Be}(\mathrm{d}, \mathrm{p}) \alpha \alpha \&{ }^{7} \mathrm{Be}(\mathrm{d}, \gamma)^{9} \mathrm{~B}$ resonant enhancement
Baryon-to-photon ratio $\eta \times 10^{10}$
$\square$ Identify ${ }^{9} \mathrm{~B}_{5 / 2+} \simeq 16.7 \mathrm{MeV} \simeq \mathrm{E}_{\text {thr }}\left(\mathrm{d}+{ }^{7} \mathrm{Be}\right)+200 \mathrm{keV}$
- Near threshold
- $\left(E_{r}, \Gamma_{d}\right) \simeq(170-220,10-40) \mathrm{keV}$ solve Li problem
- 'Large' widths

NB: both approaches assume validity of TUNLNDG tables

- Conclude "large channel radius" required

## ${ }^{9} \mathrm{~B}$ analysis: included data

$\square{ }^{6} \mathrm{Li}+{ }^{3} \mathrm{He}$ elastic Buzhinski et.al., Izv. Rossiiskoi Akademii Nauk, Ser.Fiz., Vol.43, p. 158 (1979)

- Differential cross section
- $1.30 \mathrm{MeV}<\mathrm{E}\left({ }^{3} \mathrm{He}\right)<1.97 \mathrm{MeV}$
${ }^{6} \mathrm{Li}+{ }^{3} \mathrm{He} \rightarrow \mathrm{p}+{ }^{8} \mathrm{Be}^{*}$ Elwyn et.al., Phys. Rev, C 22, 1406 (1980)
$\square$ Integrated cross section
- Quasi-two-body, excited-state, summed final channel

Data accessed via EXFOR/CSISRS database (C4 format)
$\square{ }^{6} \mathrm{Li}+{ }^{3} \mathrm{He} \rightarrow \mathrm{d}+{ }^{7} \mathrm{Be}$
D.W. Barr \& J.S. Gilmore, unpublished (1965)

- Integrated cross section
- $0.42 \mathrm{MeV}<\mathrm{E}\left({ }^{3} \mathrm{He}\right)<4.94 \mathrm{MeV}$
$\square{ }^{6} \mathrm{Li}+{ }^{3} \mathrm{He} \rightarrow \gamma+{ }^{9} \mathrm{~B}$
Aleksic \& Popic, Fizika 10, 273-278 (1978)
- Integrated cross section
- $0.7 \mathrm{MeV}<\mathrm{E}\left({ }^{3} \mathrm{He}\right)<0.825 \mathrm{MeV}$
- New to ${ }^{9} \mathrm{~B}$ analysis
- Separate ${ }^{8} \mathrm{Be}^{*}$ states

■ 2+@,200 keV [16.9 MeV], $1+@ 650 \mathrm{keV}[17.6 \mathrm{MeV}], 1+@ 1.1 \mathrm{MeV}[18.2 \mathrm{MeV}]$

- Simultaneous analysis with ${ }^{9}$ Be mirror system

## Summary

$\square$ Provided overview of current work in the LANL light nuclear reaction program
$\square$ Emphasize the utility of multichannel, unitary parametrization of light nuc data
$\square{ }^{17} \mathrm{O}$ norm issue: are Bair \& Haas ' 73 data conclusive?${ }^{9} B$ resonance spectrum:
$\square$ no resonances in ${ }^{9} \mathrm{~B}$ that reside within $\sim 200(\sim 100) \mathrm{keV}$ of the $\mathrm{d}+{ }^{7} \mathrm{Be}$ ( ${ }^{3} \mathrm{He}+{ }^{6} \mathrm{Li}$ ) threshold with 'large' widths $10-40 \mathrm{keV}$
$\square$ Appears to rule out scenarios considered by Cyburt \& Pospelov (2009) that low-lying, robust resonance in ${ }^{9} \mathrm{~B}$ could explain the "Li problem"

## End Lecture II

## BSMs scenarios

$\square$ New particles: WIMPs, Axion, SUSY, ...
$\square$ GR modifications: new propagating DsOF; scalar-tensor
$\square$ Modifications of Cosmological SM: non-zero $\nu$ chem. pot.; nonequil. phenomena
$\square$ Variation of fundamental couplings
$\square$ Cosmic variance
$\square$ Neutrino sector

- solar, atmospheric \& reactor neutrinos oscillation experiment prove at least two neutrinos have mass
$\square$ "sterile neutrinos": mass $\rightarrow$ neutrinos have left- \& right-hand spin states
- only left-hand neutrinos interact in SM
- Massless neutrinos (recall)
- have only one spin state

## Neutrino Mass: what we know and don't know

We know the mass-squared differences: $\left\{\begin{array}{l}\delta m_{\odot}^{2} \approx 7.6 \times 10^{-5} \mathrm{eV}^{2} \\ \delta m_{\mathrm{atm}}^{2} \approx 2.4 \times 10^{-3} \mathrm{eV}^{2}\end{array}\right.$

$$
e . g ., \quad \delta m_{21}^{2} \equiv m_{2}^{2}-m_{1}^{2}
$$

We do not know the absolute masses or the mass hierarchy: normal mass hierarchy inverted mass hierarchy

## Neutrino mass mixing 101

$\square$ Take-away message from experiments: "neutrinos have mass"

- neutrino flavor eigenstates
- interact via left-hand (L) components
$\left|\nu_{e}\right\rangle,\left|\nu_{\mu}\right\rangle,\left|\nu_{\tau}\right\rangle$
- Mass term, however, mixes L \& R:
$\bar{\psi}_{e} \gamma_{\mu} \frac{1}{2}\left(1-\gamma_{5}\right) \psi_{\nu_{e}}=\bar{\psi}_{e, L} \gamma_{\mu} \psi_{e, L}$
$\bar{\psi}_{e} \psi_{e}=\bar{\psi}_{e, R} \psi_{e, L}+\bar{\psi}_{e, L} \psi_{e, R}$

$$
\left(\begin{array}{l}
\left|\nu_{e}\right\rangle \\
\left|\nu_{\mu}\right\rangle \\
\left|\nu_{\tau}\right\rangle
\end{array}\right)=U_{m}\left(\begin{array}{l}
\left|\nu_{1}\right\rangle \\
\left|\nu_{2}\right\rangle \\
\left|\nu_{3}\right\rangle
\end{array}\right) \quad U_{m}=U_{23} U_{13} U_{12} M
$$

$\square$ Mass mixing matrix

$$
\begin{aligned}
U_{23} & \equiv\left(\begin{array}{ccc}
1 & 0 & 0 \\
0 & \cos \theta_{23} & \sin \theta_{23} \\
0 & -\sin \theta_{23} & \cos \theta_{23}
\end{array}\right) \\
U_{13} & \equiv\left(\begin{array}{ccc}
\cos \theta_{13} & 0 & e^{i \delta} \sin \theta_{13} \\
0 & 1 & 0 \\
-e^{-i \delta} \sin \theta_{13} & 0 & \cos \theta_{13}
\end{array}\right)
\end{aligned}
$$

$$
\theta_{12}, \theta_{23}, \theta_{13}, \delta
$$

$$
U_{12} \equiv\left(\begin{array}{ccc}
\cos \theta_{12} & \sin \theta_{12} & 0 \\
-\sin \theta_{12} & \cos \theta_{12} & 0 \\
0 & 0 & 1
\end{array}\right) \quad \begin{gathered}
\theta_{12} \approx 0.59_{-0.015}^{+0.02} \\
\theta_{23} \approx 0.785_{-0.124}^{0+1.24} \approx \frac{\pi}{4} \\
\theta_{13} \approx 0.154_{-0.065}^{+0.065}
\end{gathered}
$$

## Sterile* neutrinos

$\square$ What are they?

- Related to right-handed components
$\square$ Wherefore?

Neutrino
(left-handed)

Antineutrino (right-handed)
$\square$ Mass $\rightarrow$ right-handed neutrinos $\rightarrow$ must exist by Lorentz invariance

- but may have mass modified by interactions
- Non-interacting(?!): only example of particles that interact solely via GR
- Interactions $\rightarrow$ necessarily beyond SM physics
$\square$ What (if anything) do they do?
$\square$ perhaps they mix with active $(e, \mu, \tau)$ neutrinos?

$$
\begin{aligned}
\left|\nu_{e}\right\rangle & \cos \theta\left|\nu_{1}\right\rangle+\sin \theta\left|\nu_{2}\right\rangle \\
\left|\nu_{s}\right\rangle & \rangle=-\sin \theta\left|\nu_{1}\right\rangle+\cos \theta\left|\nu_{2}\right\rangle
\end{aligned}
$$

- then they're not really "sterile"
$\square$ Why would we want (need?) them?
- leptogenesis; baryogenesis
- BBN \& $N_{\text {eff }}$

## Hints for light sterile neutrinos?

$\square$ mini-BooNE
$\square$ neutrino oscillation experiment $\quad \nu_{e} \rightarrow \nu_{s} \rightarrow \nu_{\mu}$

- appearance with $\delta m^{2} \sim 1 \mathrm{eV}^{2}$
- result inconsistent with flavor oscillation alone
$\square$ Noutrino reactor anomaly
$\square 3 \sigma$ deficit neutrinos chacted in short-baseline ( $<100 \mathrm{~m}$ ) reactor $\nu$ experiments
$\bar{\nu}_{e}$ deficit from $\bar{\nu}_{e} \rightarrow \bar{\nu}_{s}(? ? ?)$ - a disappearance experimment
- A. Hayes et al. (2013) find "large corrections"
$\square$ Extra radiation at photon-decoupling (Neff) ??
- CMB observations (PolarBear, ACT, SPT, Planck, CMBPol,...)
$\square$ 'extra' RED could reconcile $\mathrm{H}_{0}$ and $\sigma_{8}$ inferred from CMB and astronomical observation

## Dark radiation

$\square \gamma$-decoupling (last scattering) $\mathrm{T} \sim 0.2 \mathrm{eV}(\mathrm{z} \sim 1000)$
$\square \mathrm{N}_{\text {eff }}$ : "effective number of neutrino degrees of freedom"

- A misnomer; it refers to any/all relativistic particles at decoupling
$\square$ 'Baby' formula: $\rho_{\text {rad }}=2\left[1+\frac{7}{8}\left(\frac{4}{11}\right)^{4 / 3} N_{\text {eff }}\right] \frac{\pi^{2}}{30} T_{\gamma}^{4}$
- We've done this better...

- annihilation of neutrinos-antineutrinos at weak decoupling
- QED corrections
$\square$ Measurements
- WMAP9 (201 2): 3.26(35); Planck (2013): 3.30(50); ACT(2013): 2.79(56); SPT-SZ (201 2): 3.71 (35)
$\square$ Sterile neutrinos can affect the physics of dark radiation

## CMB as a probe of steriles: caveats

$\square$ Sterile neutrinos can decay out-of-equilibrium

- "dilution": steriles are "sub-weakly" interacting
$\square$ non-thermal energy spectra/number densities
$\square$ Care must be applied when
$\square$ computing $N_{\text {eff }}$ : non-equilibrium effects; relativistic vs. non-relativistic kinematics
$\square$ determining $N_{\text {eff }}$ and $Y_{p}$ (mass fraction ${ }^{4} \mathrm{He}$ )
- current Planck collab. procedure is inconsistent w.r.t. $N_{\text {eff }}$ and $Y_{p}$
- in preparation: "Neutrino physics in the era of precision cosmology"
$\square$ neutron/proton ratio (and therefore ${ }^{4} \mathrm{He}$ )
$\square$ competing weak reaction rates determine $Y_{p}\left({ }^{4} \mathrm{He}\right)$
$\square$ very sensitive to neutrino energy spectra

## Dilution physics (I)

$\square$ Consider the presence of $\nu_{s}$

- heavy ( $\sim 100 \mathrm{MeV}$ ), unstable ( $\sim 10 \mathrm{~s}$ )
$\square$ Thermal effects
- Assume interaction of steriles sufficiently strong at T~few GeV to maintain thermal equilibrium with e, $\nu, \gamma, \ldots$
- Further, the sterile decouples at $\mathrm{T} \sim \mathrm{few} \mathrm{MeV}$

$$
s=\frac{\rho+p}{T}=g_{*}(a) \frac{2 \pi^{2}}{45} T^{3}
$$

- assume relativistic kinematics throughout
- proper entropy is conserved: $s a^{3}=$ constant (FLRW)
- sterile neutrino temperature distribution cooled or "diluted"

$$
\frac{T_{\nu_{s}}\left(a_{w d c}\right)}{T_{\gamma}\left(a_{w d c}\right)}=\left(\frac{g_{*}\left(a_{w d c}\right)}{g_{*}\left(a_{\nu_{s} d c}\right)}\right)^{1 / 3}=\left(\frac{10.75}{61.75}\right)^{1 / 3} \approx \frac{1}{1.8}
$$

- number density comparable to photons (since lifetime chosen 10's secs)
- $\mathrm{n}\left(\nu_{\mathrm{s}}\right) \sim 0.1 \mathrm{n}(\gamma)$

NB: $\nu_{s}$ is out-of-equilibrium with $e \mu \nu \gamma$

## Dilution physics (II)

$\square$ Heavy particle decay during/after weak decoupling

- Interactions

| Exothermic | Endothermic |  |
| :--- | :--- | :--- |
| $\nu_{s} \rightarrow 3 \nu_{i}$ | $\nu_{s} \rightarrow \nu_{i}+e^{-}+e^{+}$ | $\nu_{s} \rightarrow \nu+\pi^{0}$ |
| $\nu_{s} \rightarrow \nu_{i}+\gamma$ | $\nu_{s} \rightarrow \nu+\mu^{+}+\mu^{-}$ | $\nu_{s} \rightarrow \pi^{ \pm}+e^{\mp}$ |
|  |  | $\nu_{s} \rightarrow \pi^{ \pm}+\mu^{\mp}$ |

$\square$ Entropy production
$\square$ due to out-of-equilibrium decay
plasma cools slower than decoupled actives
$\square$ Dilution

- decoupled actives diluted down
- Two effects
- coupling to plasma $\rightarrow$ reduction in $N_{\text {eff }}$
- coupling to actives $\rightarrow$ increase $\mathrm{N}_{\text {eff }}$

## Dilution phyiscs (III)

$\square$ Photons thermalize

- sterile neutrino decay ( $\mathrm{m}_{\mathrm{s}}<$ few GeV )
$\square$ But active neutrinos may not
$\square$ energy/decay-epoch dependent

$$
\begin{aligned}
\nu_{s} \rightarrow & \pi^{0}+\nu_{e, \mu, \tau} \rightarrow 2 \gamma+\nu_{e, \mu, \tau} \\
\nu_{s} \rightarrow & \pi^{+}+e^{-} \rightarrow 2 \gamma+3 \nu \\
& \vee_{\mu^{+}}+\nu_{\mu} \\
& \searrow^{+}+\bar{\nu}_{\mu}+\nu_{e} \\
\nu_{s} \rightarrow & \pi^{+}+\mu^{-} \rightarrow 2 \gamma+5 \nu
\end{aligned}
$$

$\square$ Heavy sterile neutrino decay
$\square$ dilution of background $(\mathrm{C} \nu \mathrm{B})$
$\square$ generation of radiation energy density: $\mathrm{N}_{\text {eff }}$
$\square$ prodigious entropy production

## Non-equilibrium distribution of $\mathrm{C} \nu \mathrm{B}$

- Heavy sterile dilutes the normal background neutrino spectrum
- decay-generated spectrum $\sim 10^{3}$ times more energetic than standard; never nonrelativistic
- can't detect neutrino rest mass cosmologically

The Big Question: what effect on BBN? $Y_{p}$

## Code capabilities \& design

$\square$ Capabilities
$\square$ Boltzmann equation solver: two classes of Boltzmann equations
■ Nucleosynthesis: Unitary Reaction Network for BBN (previous slides)

- Neutrino energy transport: new capability - never before achieved

$$
\begin{gathered}
\frac{D f_{1}}{D t}=\int \frac{s}{2 E_{1}} \frac{d^{3} p_{2}}{(2 \pi)^{3}\left(2 E_{2}\right)} \frac{d^{3} p_{3}}{(2 \pi)^{3}\left(2 E_{3}\right)} \frac{d^{3} p_{4}}{(2 \pi)^{3}\left(2 E_{4}\right)} \\
\left.\times\left.\langle | \mathcal{M}\right|^{2}\right\rangle(2 \pi)^{4} \delta^{4}\left(P_{1}+P_{2}-P_{3}-P_{4}\right) F\left(p_{1}, p_{2}, p_{3}, p_{4}\right) \\
\frac{D f_{1}}{D t}=\frac{\kappa}{32(2 \pi)^{3}} \int_{0}^{\infty} p_{1} p_{2}^{3} d p_{2} \int_{-1}^{1} d x \frac{(1-x)^{2}}{\sqrt{p_{1}^{2}+p_{2}^{2}+2 p_{1} p_{2} x}} \int_{E_{\min }}^{E_{\max }} d p_{3} F\left(p_{1}, p_{2}, p_{3}, p_{1}+p_{2}-p_{3}\right) .
\end{gathered}
$$

- Various reactions result in seven evaluations of this triple integral
- Achieved short turn-around time by parallelization
$\square$ Design
$\square$ Modular code design for adaptability for public code release
$\square$ Allow insertion of "physics packages" to test BSM (not just sterile $\nu$ 's)

## Code testing/preliminary results

$\square$ Evolve assuming equilibrium from $30 \mathrm{MeV} \rightarrow 3 \mathrm{MeV}$
$\square$ Then turn-on only elastic $\nu$-lepton scattering

$$
\nu_{i}+e^{ \pm} \rightarrow \nu_{i}+e^{ \pm} \quad i=e, \mu, \tau
$$

$T_{\nu}=2.892 \mathrm{E}+01 \mathrm{MeV}$

$\square$ since the $\nu$ \& anti- $\nu$ are cooler than the $\mathrm{e}^{ \pm}$ anticipate upscattering

## Code testing/preliminary results

$\square$ Evolve assuming equilibrium from $30 \mathrm{MeV} \rightarrow 3 \mathrm{MeV}$
$\square$ Then turn-on only elastic $\nu$-lepton scattering

$$
\nu_{i}+e^{ \pm} \rightarrow \nu_{i}+e^{ \pm} \quad i=e, \mu, \tau
$$

$T_{\nu}=1.134 \mathrm{E}-01 \mathrm{MeV}$

$\square$ since the $\nu$ \& anti- $\nu$ are cooler than the $\mathrm{e}^{ \pm}$ anticipate upscattering

## Code testing/preliminary results

$\square$ Evolve assuming equilibrium from $30 \mathrm{MeV} \rightarrow 3 \mathrm{MeV}$
$\square$ Then turn-on only elastic $\nu$-lepton scattering

$$
\nu_{i}+e^{ \pm} \rightarrow \nu_{i}+e^{ \pm} \quad i=e, \mu, \tau
$$

$T_{\nu}=3.875 \mathrm{E}-02 \mathrm{MeV}$

$\square$ since the $\nu$ \& anti- $\nu$ are cooler than the $\mathrm{e}^{ \pm}$ anticipate upscattering

## Code testing/preliminary results

$\square$ Evolve assuming equilibrium from $30 \mathrm{MeV} \rightarrow 3 \mathrm{MeV}$
$\square$ Then turn-on only elastic $\nu$-lepton scattering

$$
\nu_{i}+e^{ \pm} \rightarrow \nu_{i}+e^{ \pm} \quad i=e, \mu, \tau
$$

$T_{\nu}=1.886 \mathrm{E}-03 \mathrm{MeV}$

Elastic scattering

| Initial transport <br> temperature [keV] | $N_{\text {eff }}$ |
| :--- | :--- |
| 20 | 3.0055 |
| 40 | 3.0055 |
| 100 | 3.005666 |
| 200 | 3.005936 |
| 400 | 3.006555 |
