

# GTC/Osiris spectra of $z \sim 1$ superdense E/S0s

Jesús Martínez, Rafael Guzmán  
et al. (UCM/IAC collaborators)

# The Mass-Size Relation

$$M_{\text{dyn}} \propto R_{\text{eff}} \sigma^2$$

$$\sigma > 400 \text{ km/s}$$

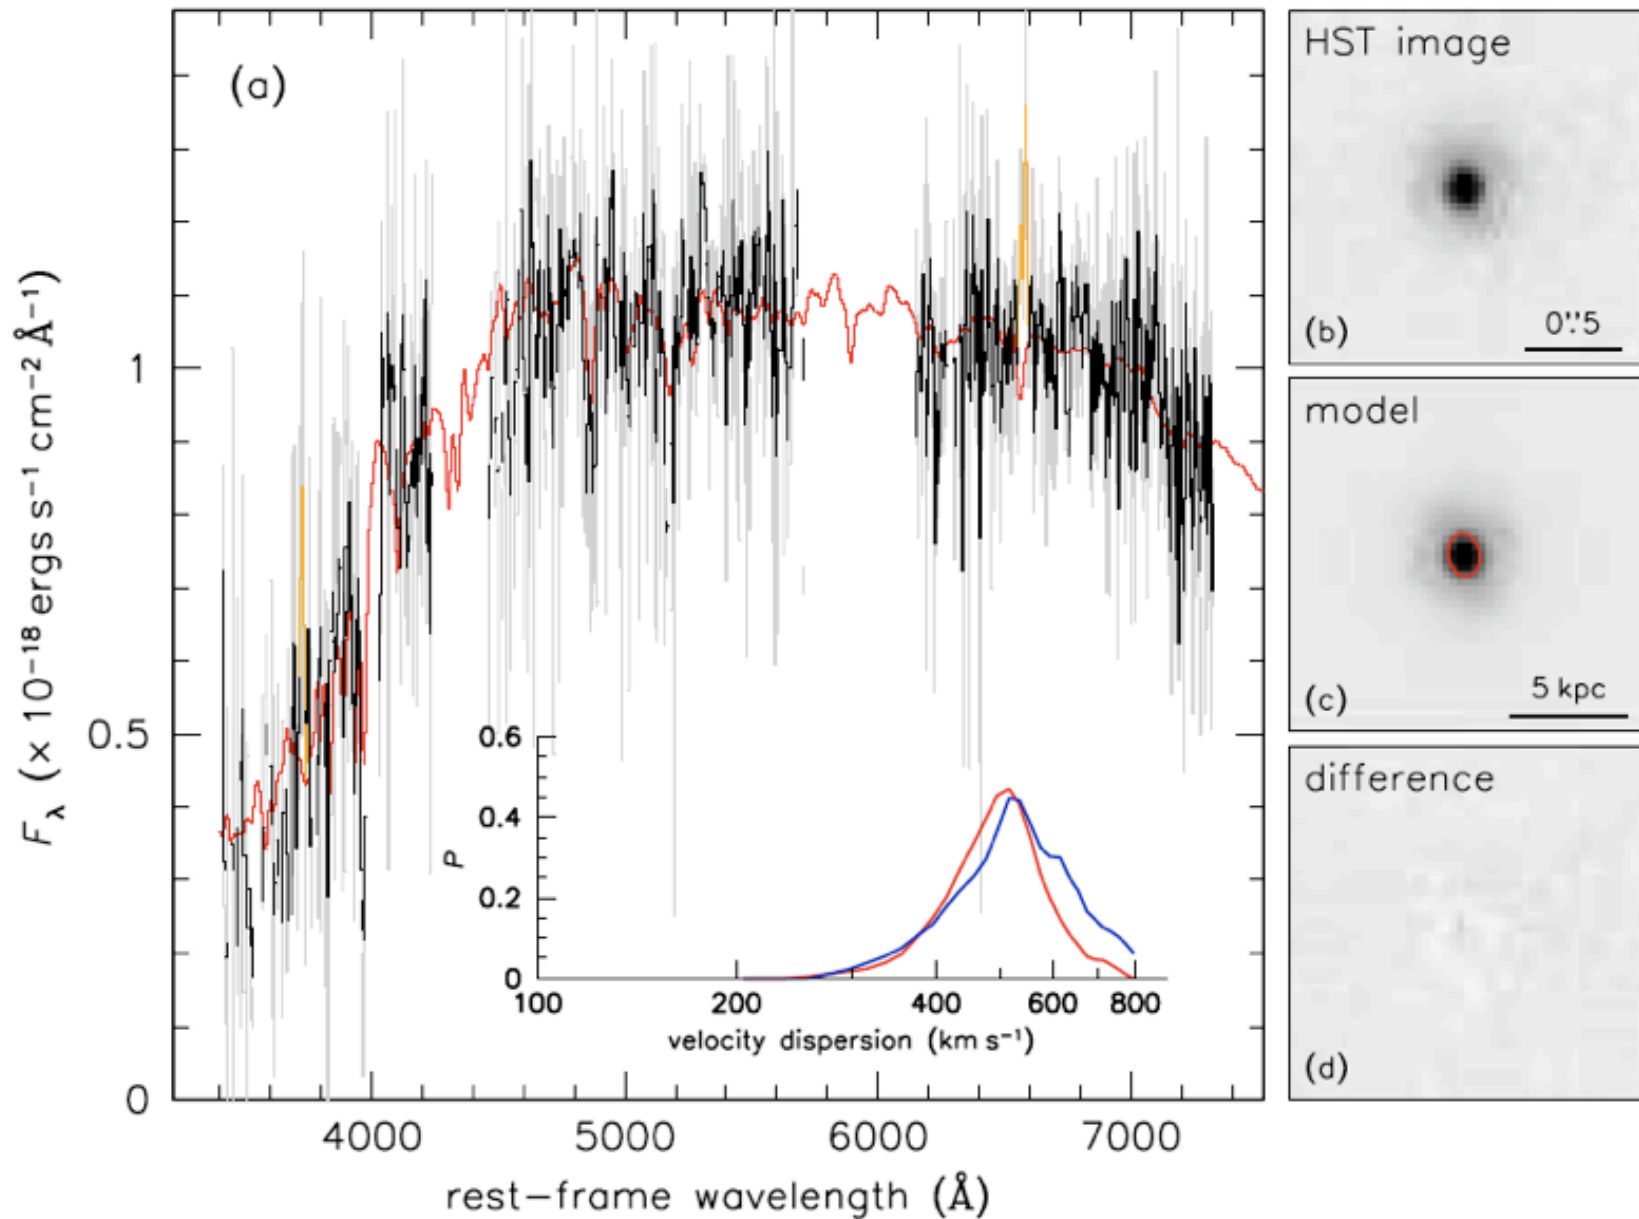

(Trujillo+ 07; Pérez-González+ 08; cf. Mancini+10)

(van Dokkum+ 09,10; Cimati+ 09; Cenarro & Trujillo 10; Newman+10)

# The Mass-Size Relation

(van Dokkum+ 09, 10:  $\sigma \sim 500 \text{ km/s}$ )

# The Mass-Size Relation

(Newman+ 10:  $\sigma \sim 150 - 300$  km/s)

# The Mass-Size Relation

(Newman+ 10:  $\sigma \sim 150 - 300 \text{ km/s}$ )

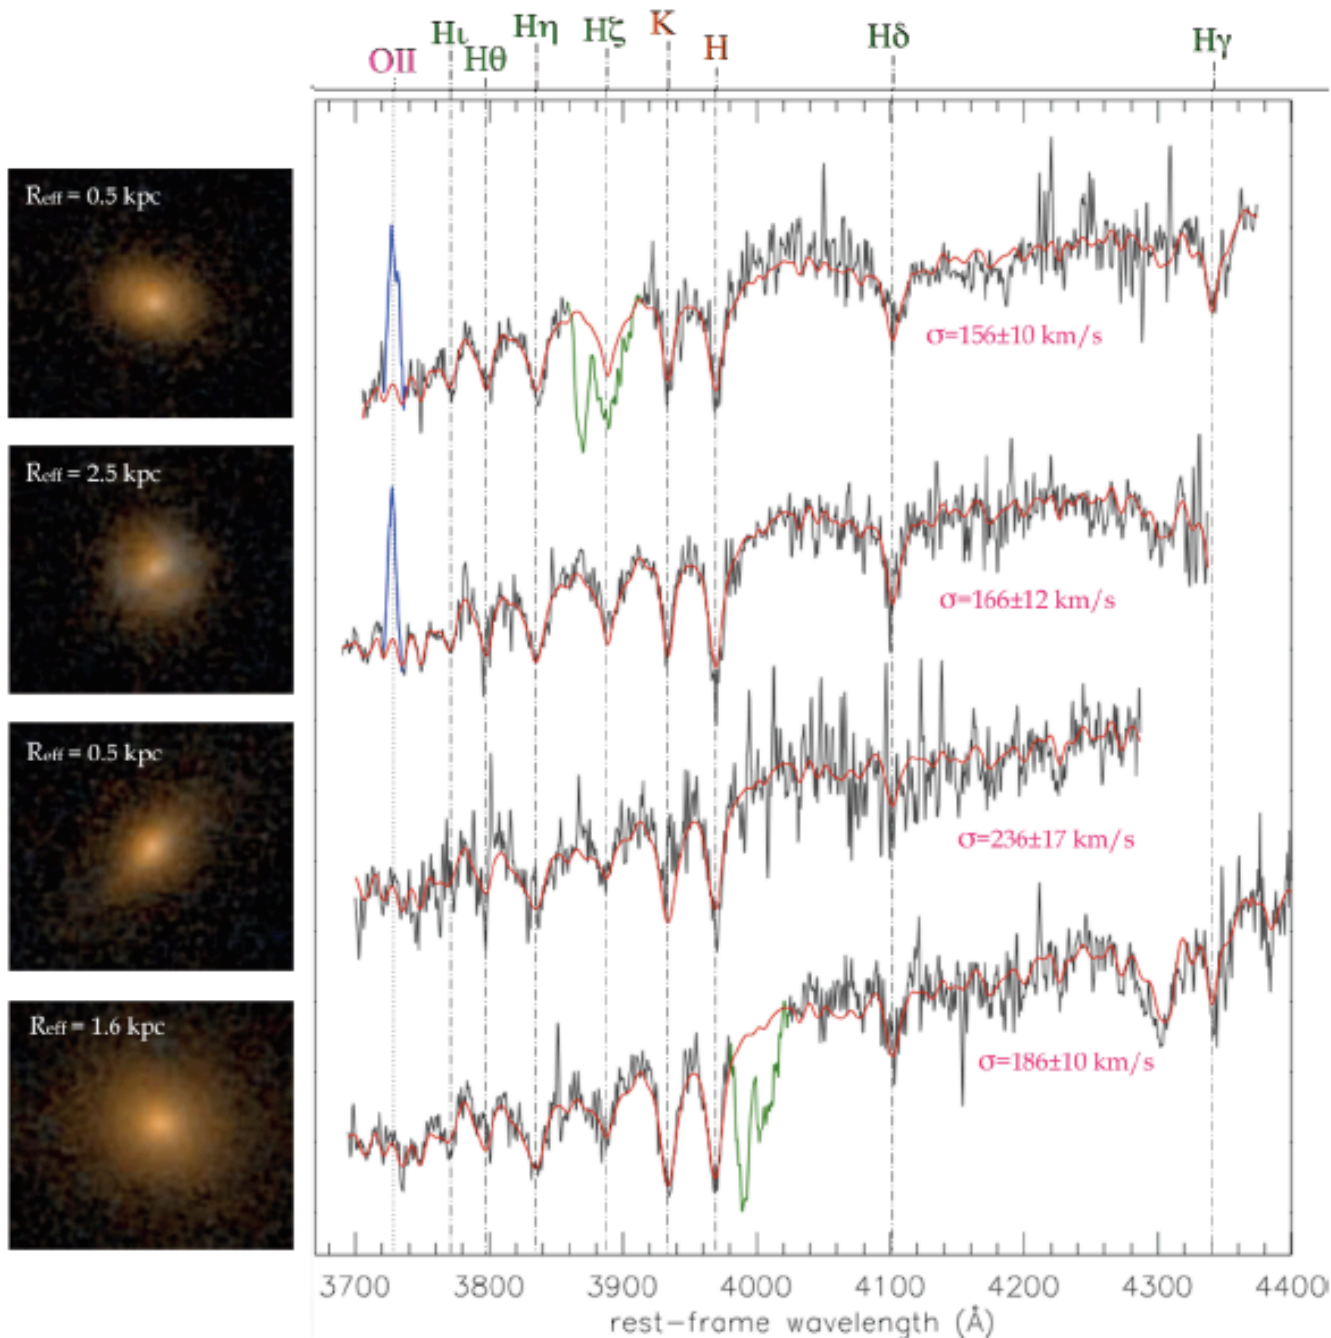

# GTC/Osiris Spectra of E/S0s at $z \sim 1$

“Superdense” massive E/S0s at  $z \sim 1$ :  $M_{\text{star}} > 10^{11} M_\odot$ , lowest  $R_e$  at a given  $M$

# GTC/Osiris Spectra of E/S0s at $z \sim 1$

- $\sigma_{\text{ave}} \sim 190 \text{ km/s}$ :
  - ▶  $M_* \downarrow, R_e \uparrow \sim \times 6$
  - ▶  $(v_r \sin i < 100 \text{ km/s})$
- age  $\sim 1\text{-}2 \text{ Gyr}$ :
  - ▶  $z_{\text{form}} \sim 1.5$
- $[\text{OII}]_{3727}$ :
  - ▶  $\text{SFR} \sim 7 \text{ Mo/yr}$
  - ▶  $\text{SFR}_{\text{MIR}} \sim 15 \text{ Mo/yr}$

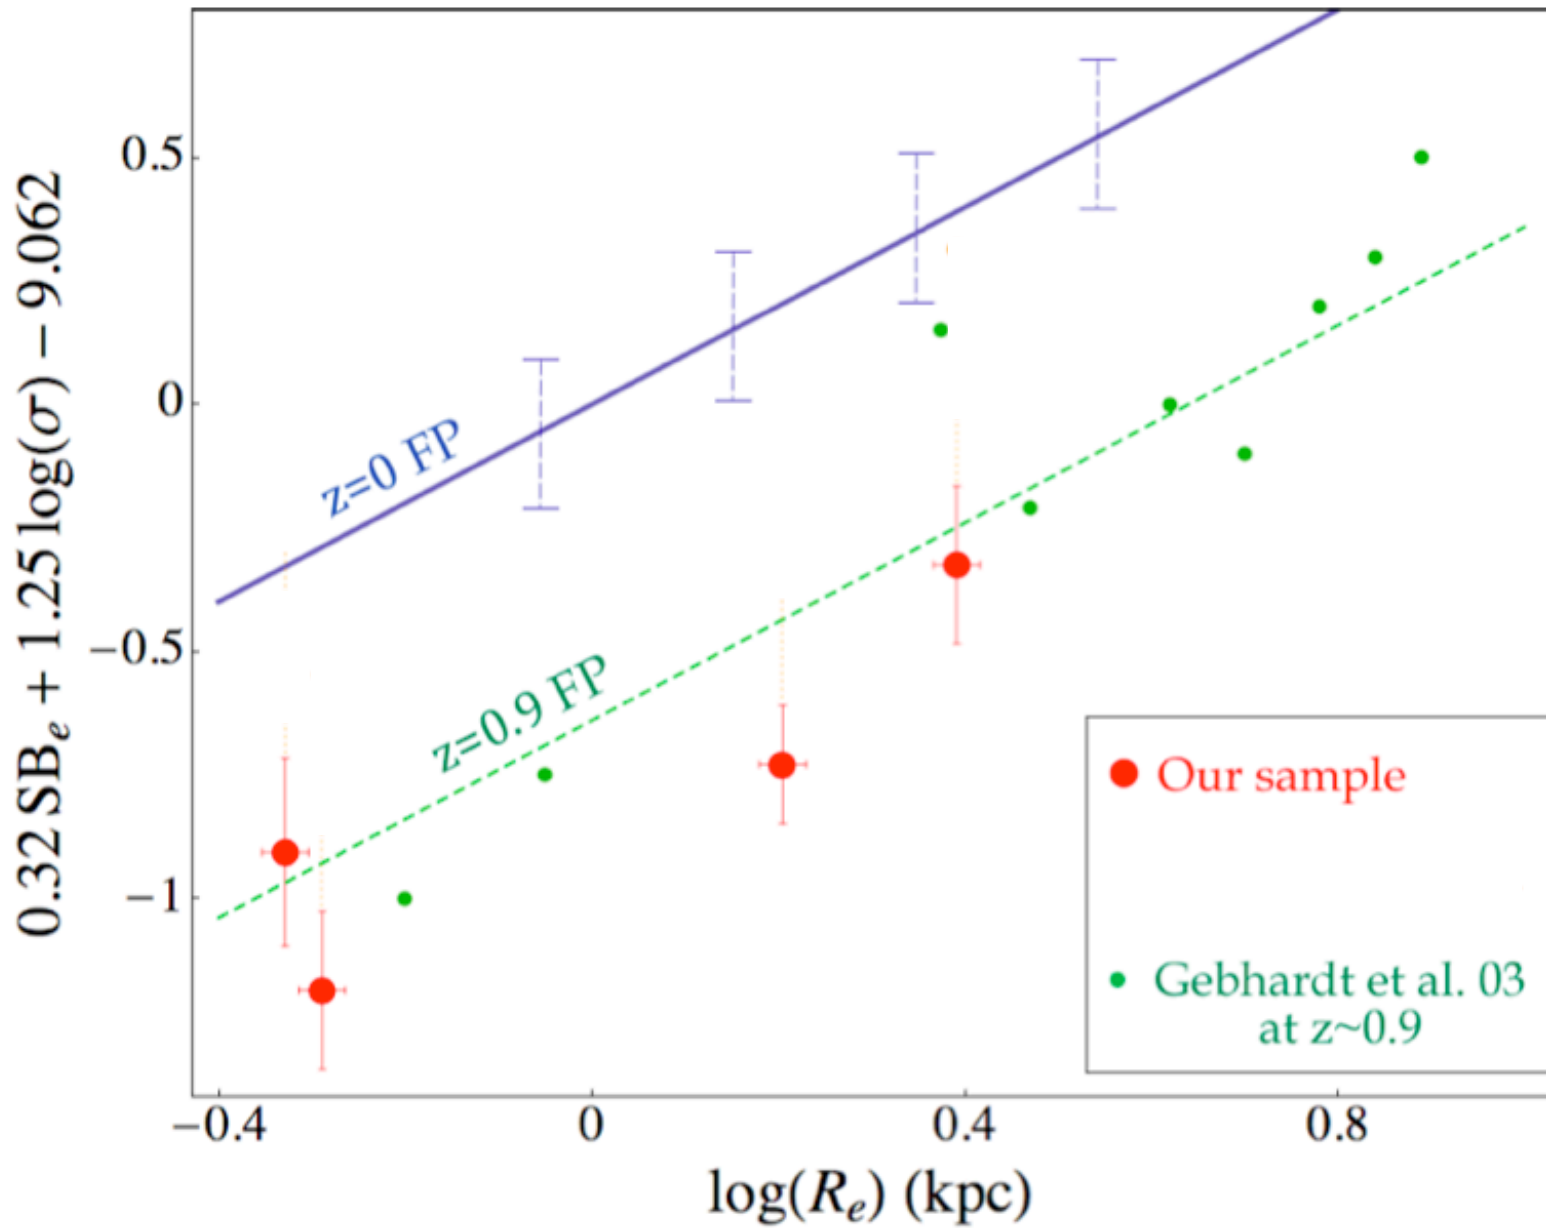

# The Mass-Size Relation

# Fundamental Plane

# Passive Luminosity Evolution

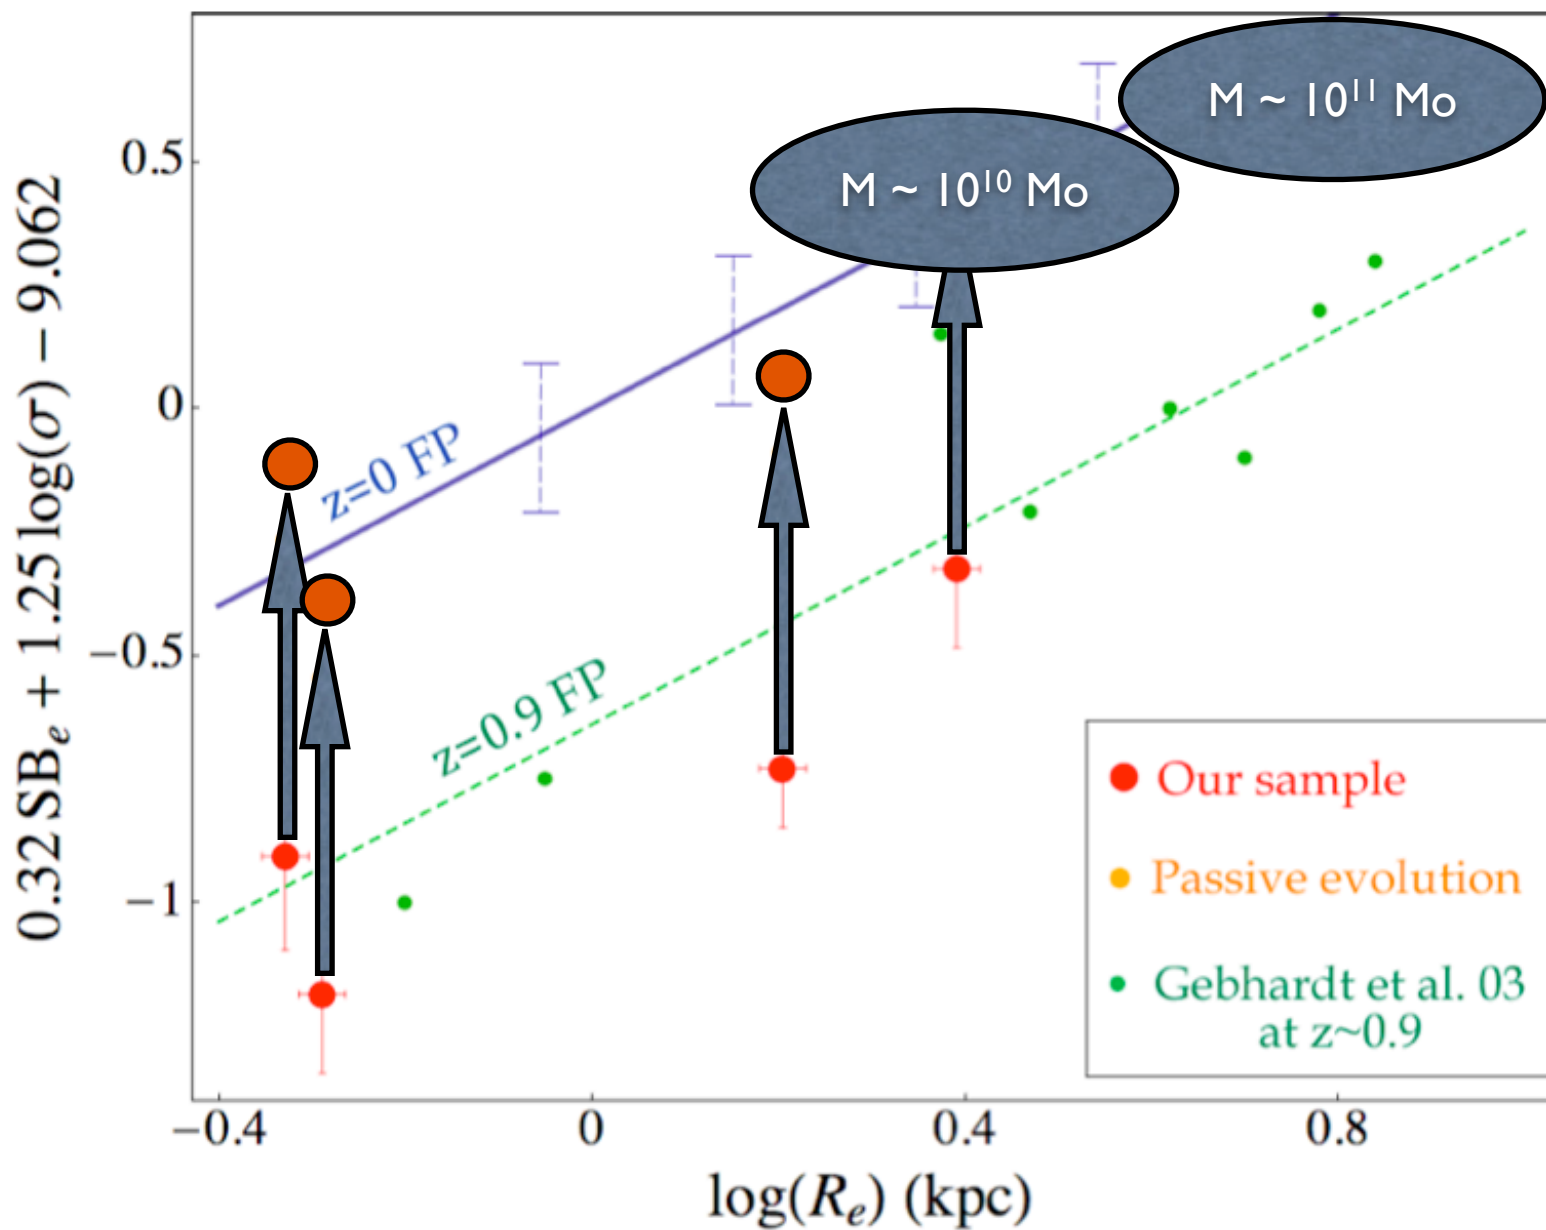

# FP Evolution: fading

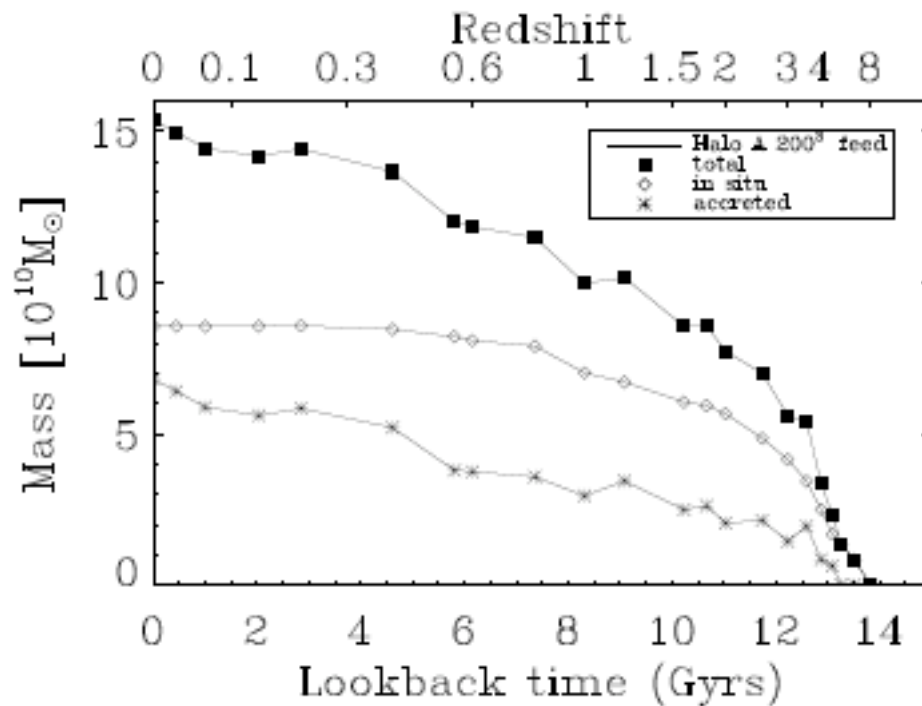

# FP Evolution: fading

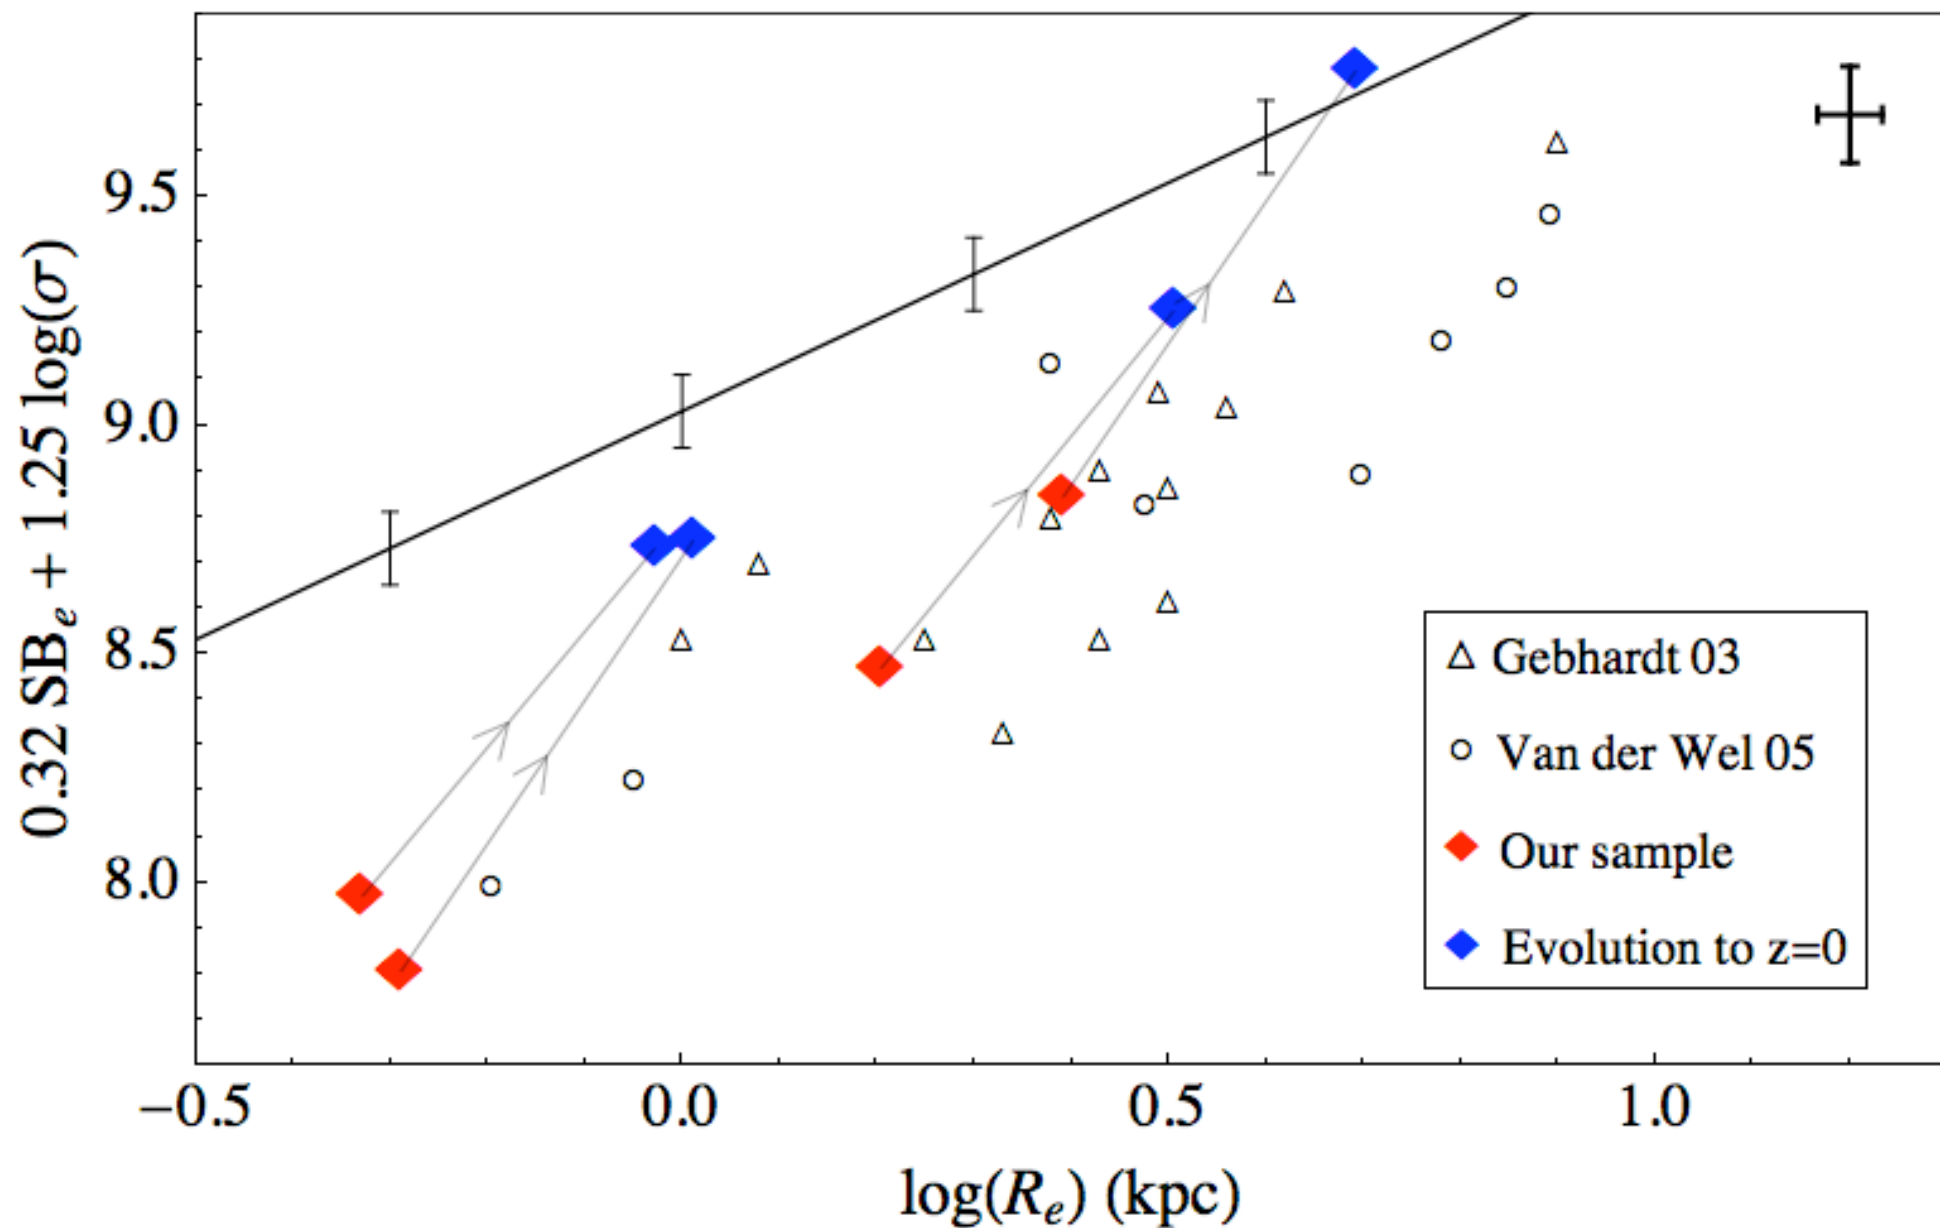

# Mass/Size Evolution: minor mergers

Minor dry mergers since  $z \sim 1$ :  
 $\Delta M \sim \times 1.5$ ,  $\Delta R_e \sim \times 1.8$ ,  $\Delta \sigma \sim \times 0.8$   
(Naab et al. 2009)

# FP Evolution: mass, size & fading

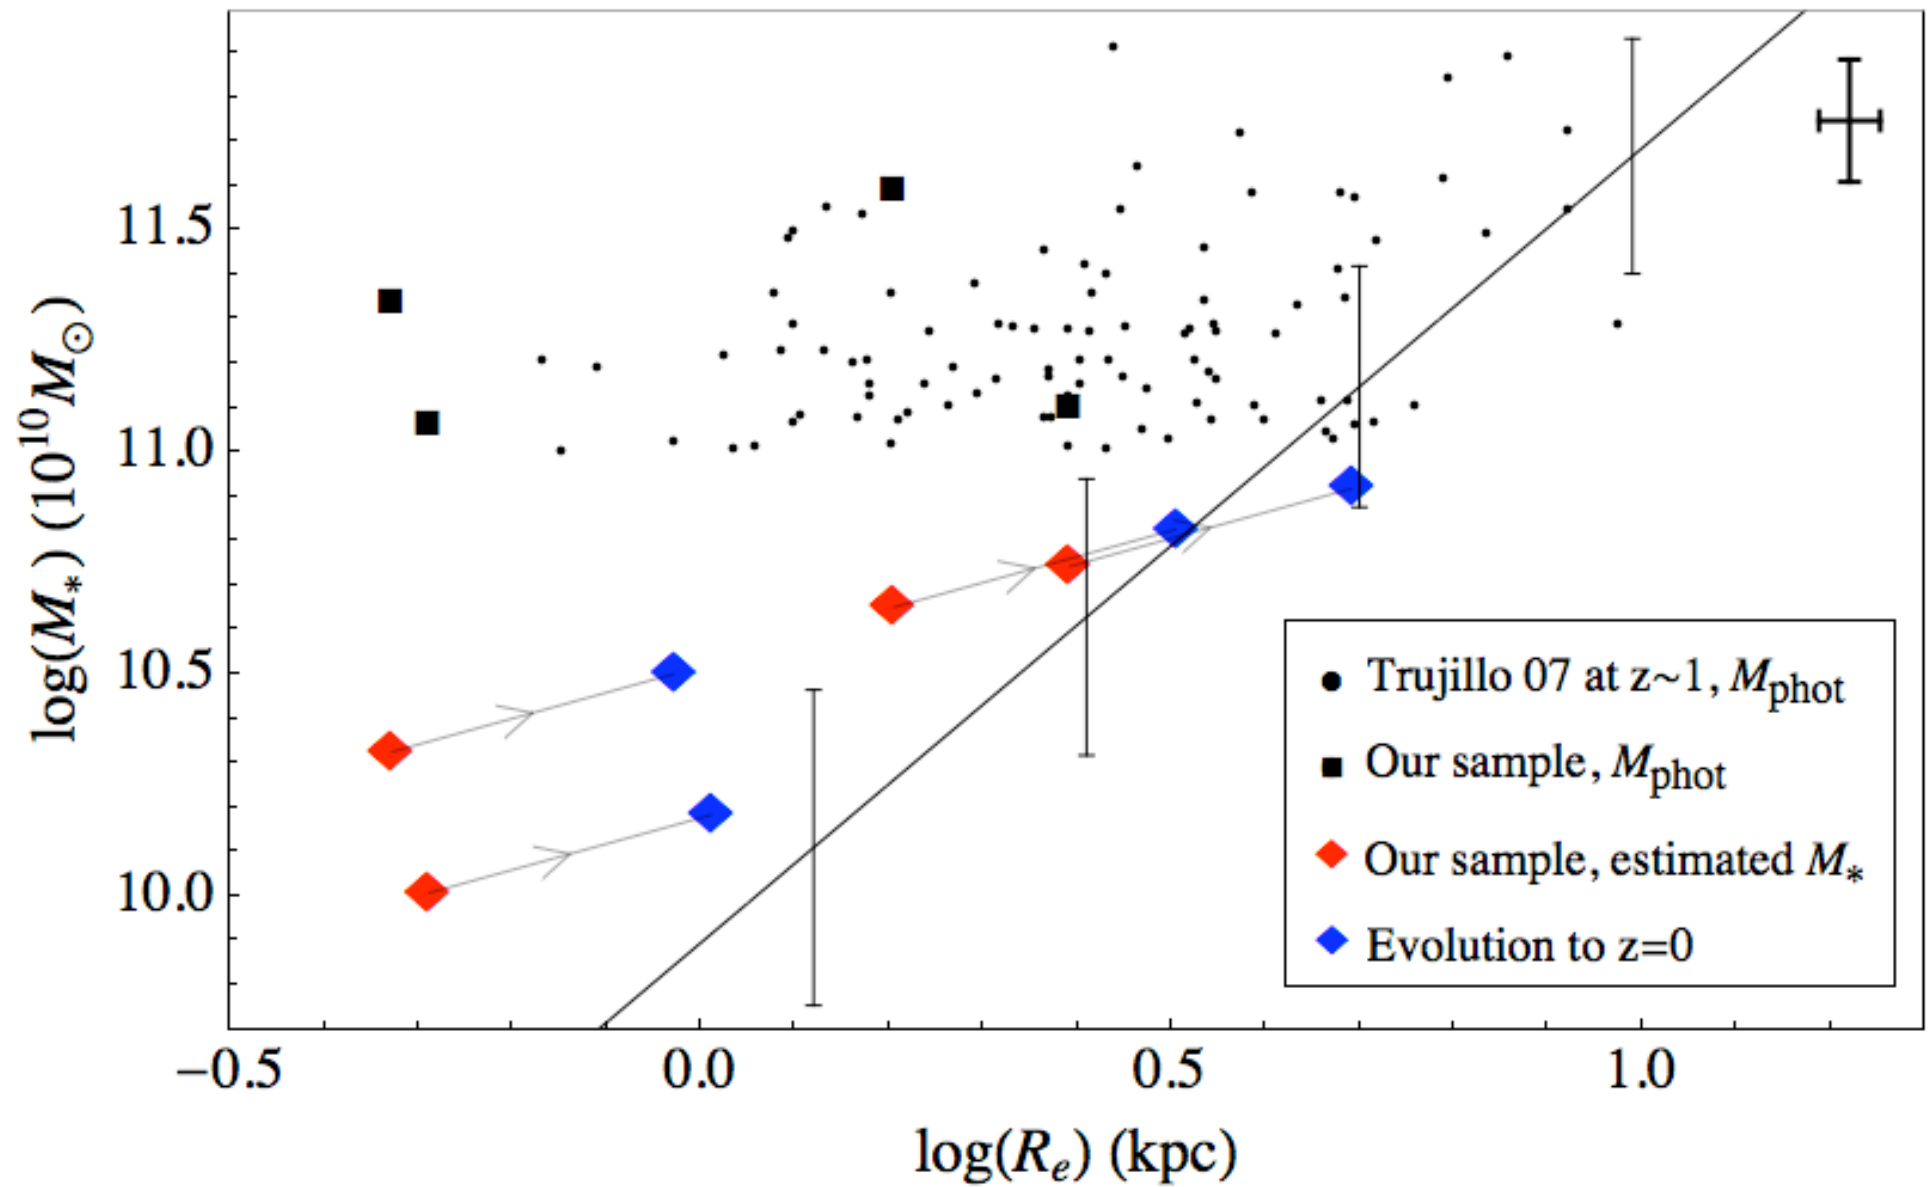

# FJ Evolution: mass & fading

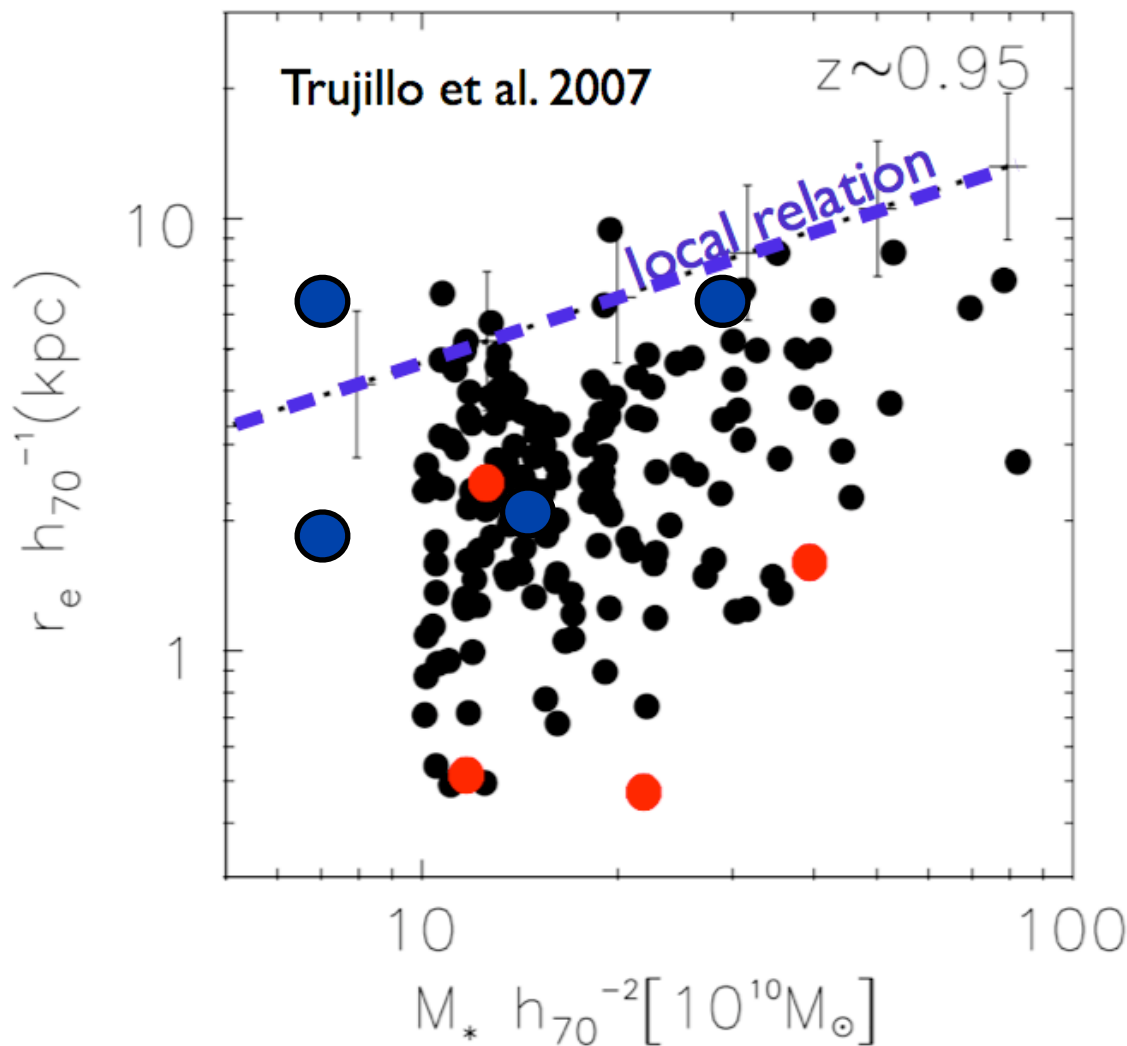

# M-Re Evolution: mass, size

- GTC spectra of 4 superdense E/S0s at  $z \sim 1$ :
- $\sigma \sim 190$  km/s:
  - ▶  $M_{\text{star}} \downarrow \sim \times 6$
- average age:  $\sim 1$ -2 Gyr
- [OII]<sub>3727</sub> (+MIR) emission: SFR  $\sim 10$ -20 Mo/yr
- FP, F-J and M-Re analysis consistent with a simple evolutionary scenario from  $z \sim 1$  to  $z \sim 0$ :
  - ▶ Fading:  $\Delta M_B \sim 2.4$  mag
  - ▶ Minor mergers:  $\Delta M \sim \times 1.5$ ,  $\Delta R_e \sim \times 1.8$ ,  $\Delta \sigma \sim \times 0.8$

(see Martínez, Guzmán+ 11, ApJL, in press, astro-ph arXiv:1107.4640)

# The Mass-Size Relation

$$\begin{aligned} R_e(z=0) &\sim 2.5 R_e(z=1) \\ &\sim 4 R_e(z=2) \end{aligned}$$

$$\text{V.T.: } M_{\text{dyn}} \propto R_{\text{eff}} \sigma^2$$

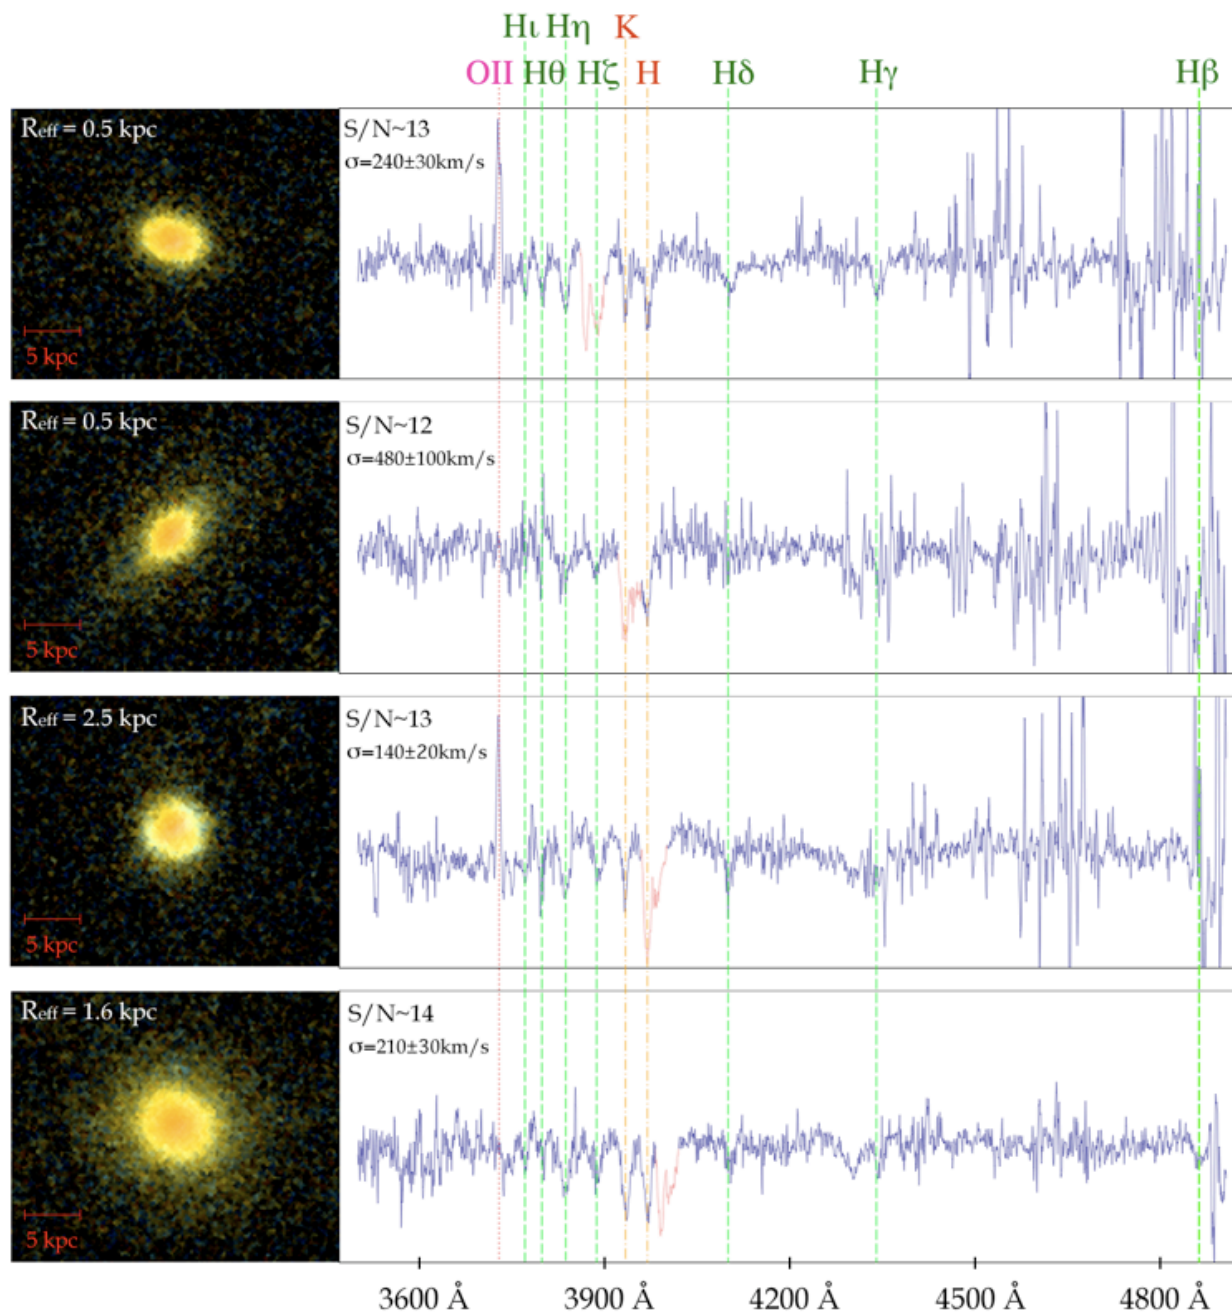

$$M_* \sim M_{\text{dyn}}: \sigma \sim 600 \text{ km/s}$$

(Trujillo et al. 07; Pérez-González et al. 08; cf. Mancini et al. 10)

(van Dokkum et al. 09, 10; Cimati et al. 09; Cenarro & Trujillo 09)

# GTC/Osiris Spectra of E/S0s at $z \sim 1$

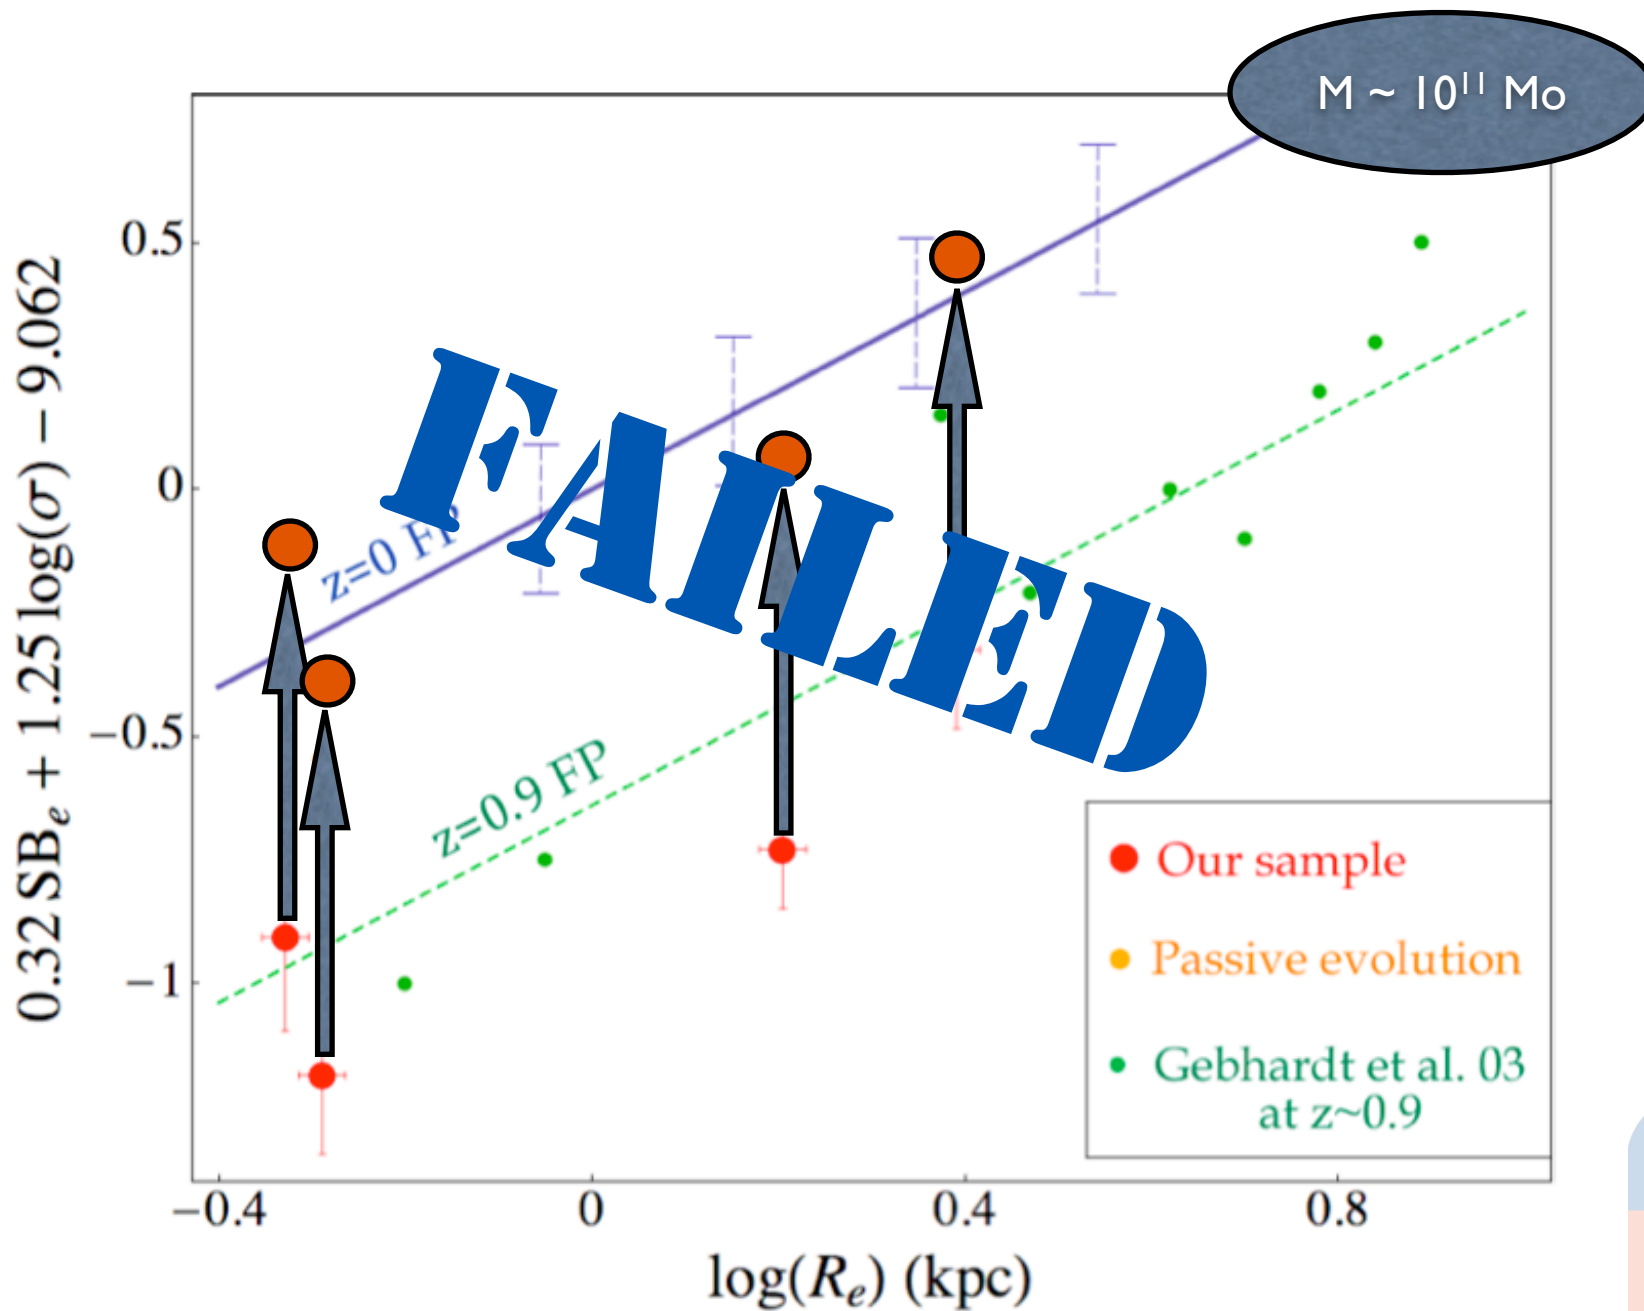

- $\sigma \sim 250$  km/s:
  - ▶  $M_* \downarrow, R_e \uparrow \sim \times 2$
  - ▶  $v_r \sim 400$  km/s
  - ( $v_r \sin i < 100$  km/s)
- age  $\sim 1$ -3 Gyr:
  - ▶  $z_{\text{form}} \sim 1.5$
- [O II]<sub>3727</sub>:
  - ▶ SFR  $\sim 7$   $M_{\odot}/\text{yr}$
